Abstract

Alongside the proliferation of commercial generative AI products in the past two years, HCI research focused on the usage of such tools has been conducted at a remarkable volume. This new area of study has been critical to various degrees of the systems which create and uphold these technologies. However, as the deployment of generative AI products has engendered many observable harms, HCI work in this area is now more relevant than ever. While thoughtful research can uncover and promote symbiotic applications of AI technologies, uncritical work can contribute to normalization of harmful uses, skew public perception of technologies, or serve to advance business interests.

The aim of this panel is to revisit the attitudes the HCI community holds towards generative AI and provide a forum to interact with an industry that has seen the first upheavals caused by this technology, the creative arts.

1 Introduction

This panel aims to discuss the state of Human-Computer Interaction research on generative AI products, its role in the burgeoning generative AI industry, and the interactions between the research and stakeholders at large. Through interaction with working artists, a group at the forefront of generative AI's impact, we seek to foster a more purposeful strain of HCI research on generative AI.

2 Summary

There has been a surge in HCI and CHI research using generative AI for a broad range of tasks, including simulating participants or respondents[14, 24], generating ideas[18, 22, 29, 30], education technology[21], facilitating interactions between people[10], and many other applications[3, 20]. Generative AI holds the potential to make many HCI tasks faster, cheaper, and potentially less error prone.

Simultaneously, another field which has closely seen the direct impact of generative AI is that of the creative arts and media. Since 2022, it has played a part in the production of many works, and also allowed creatives to explore generative AI as a new medium of its own. Generative technologies have inspired new forms of procedural art (e.g., Anna Ridler's *Mosaic Virus*, 2019, an image generator trained on tens of thousands of photos of tulips taken by the artist and used to generate images of tulips which vary in function of the price of bitcoin, harkening to the tulip bubble of the 17th century¹), and made media more accessible to the public (e.g., generated speech broadening access to periodical publications which would be too massive to dub manually on a frequent basis [17]), or helped preserve threatened forms of communication

¹<http://annaridler.com/mosaic-virus>

(e.g., Te Hiku’s community-managed Māori-English transcription service²).

However, generative AI has significant drawbacks: it requires immense energy and other resources to train and use[7], it often produces biased, toxic, incorrect, and otherwise undesirable content[6, 8, 9, 15]. For artists and entertainers, generative image AI has been used to replicate the styles of living artists, causing severe economic harms[2] and representation harms as artists lose control of their styles and brands[16]. Similarly, large language models and voice generation models have been trained on the work of writers, voice actors, singers, journalists, and other workers, taking their unique styles without consent and causing severe economic harms while weakening the labor power of these already often marginalized workers. Many of these workers argue that generative AI poses and existential threat to their artistic professions and careers[1].

In this panel, we foreground impacts generative AI pose to artists and other creatives, highlighting potentials in accessibility, creativity, and equity, as well as labor, intellectual property, and economic harms and risks. In the face of upheaval and uncertainty towards risks presented by generative AI, HCI researchers, practitioners, and professionals have a significant role to play in imaging if and how generative AI will be used, setting norms for ethical use, shaping perception of the technology, and using our sociotechnical expertise to mitigate generative AI harms. In this panel, we will bring together several working artists to discuss how generative AI is impacting their communities for a discussion with HCI and security researchers who are both using generative AI in their work and conducting research on mitigating and resisting generative AI harms. The discussion will cover two main topics. First, how do we balance tensions between generative AI’s potential in HCI with the harms caused by its use? Second, what is an HCI research agenda for mitigating and resisting generative AI harms to creative workers?

Our panel discussion will allow the CHI community to hear directly from artists being impacted by HCI. Our panel will ensure these experiences and needs are not being overlooked, and start a productive and balanced discussion on how CHI should approach and address these issues. Vitally, our panel will engage with Japanese artists grappling with the impacts of generative AI on their professions, building connections with other groups of artists and helping CHI engage with pressing technology and HCI issues of our host country.

2.1 Prior Related Events

This panel serves as the spiritual successor to two sessions held at FAccT in 2023 and 2024, titled “AI Art” and *Its Impact on Artists* [13] and *Artists and the Impact of AI Art: A Discussion on AI Regulation Activism* [17], respectively. Both events were co-organized by Harry Jiang and the latter also by Tim Friedlander. In these events, working artists in various modalities were invited to speak on the harms they have observed on their professions from the deployment of image and audio generative AI, and engage in a conversation with researchers on ways research can complement stakeholder needs and assist in activism. In the second installment, additional focus was given to efforts from artist groups to counter the intrusion of

generative AI in their fields, such as political advocacy, labour action, and technical collaboration with researchers; this exploration served as a roadmap to organizing in the face of new power structures brought about by this new technology. The sessions have also featured artists in the creative industry local to the conferences’ host countries (USA in 2023, Brazil in 2024) and a breadth of foreign regions (North America, European Union, South America) at each session.

3 Panel Organization

3.1 Panel Composition

- **Moderator: Harry H. Jiang** is PhD Candidate in Electrical and Computer Engineering at Carnegie Mellon University.
- **Josephine Passananti** is PhD Student in Computer Science in the SAND Lab at the University of Chicago, whose research focuses on applying technical methods to promote positive applications of AI for communities and defend against malicious ones. She has worked on influential usable security works such as Nightshade [27] and Gimbal [25] which seek to empower individuals and levelling power dynamics in social machine learning systems, the latter two aimed at intellectual property abuses of generative AI. The SAND Lab, directed by Profs. Ben Y. Zhao and Heather Zheng, is also known for developing Fawkes [28] and Glaze [26] in the same area.
- **Sarah Fox** is an Assistant Professor at Carnegie Mellon University in the Human-Computer Interaction Institute, where she directs the Tech Solidarity Lab. Her research includes works on the influence of AI systems on labour, such as surveillance in the workplace [4, 31] or integration into the workplace [11, 12, 19]. Her work also takes sectoral perspectives of AI in the workplace, covering areas such as care work [4] and public transit [5].
- **Michael Bernstein** is an Associate Professor of Computer Science at Stanford University, where he is a Bass University Fellow and Interim Director of the Symbolic Systems program. His research focuses on designing social, societal, and interactive technologies, including seminal work on generative agents [23].
- **Megumi Ogata** is a voice actress and singer based in Japan specializing in dubbing for animation. She is known for voicing beloved characters in popular media such as the main character, Shinji Ikari, from *Neon Genesis Evangelion*, Sailor Uranus from the *Sailor Moon* franchise, and Yuta Okkotsu from the *Jujutsu Kaisen* series. She will also be speaking as a member of “NOMORE-MUDAN GENERATIVE AI”³, a group of voice actors advocating for regulation of generative AI and reconciliation between tech and the arts. Voice acting is a field in a precarious situation with regards to the introduction of generative AI: the outputs of audio models aim to not only mimic and replace the labour of professionals, but also an inherent part of their personal identity. This artform, as an integral part of modern mass media, is also viscerally tied to the expression of identities in society at

²<https://kaituhi.nz/>

³<https://nomore-mudan.com/>

large, thus broadening the scope of ethical questions regarding the use of generative AI in the field. Moreover, the voice acting field is one where generative AI has many identified potentials for mutually beneficial collaboration. As the host country of CHI '25, we find it necessary to represent local artists in Japan, especially as the country is a major cultural producer and exporter.

- **Karla Ortiz** is a Puerto Rican, US-based painter and concept artist best known for her illustrations in the *Magic: the Gathering* card game⁴ and concept art contributions to film and video game productions by Marvel Studios, Ubisoft, and Industrial Light & Magic. She is also a primary plaintiff on the key class-action lawsuit against image generator companies *Andersen v. Stable Diffusion*⁵ which seeks significant damages from the developers and distributors of generative AI products Stable Diffusion, Midjourney, DreamUp, and Runway for copyright infringement in the unauthorized use of the plaintiff's works in training data for the large generative models underlying the products.

3.2 Organizers

Harry H. Jiang is a PhD candidate in Electrical and Computer Engineering at Carnegie Mellon University, with a research interest in machine learning systems, ML infrastructure, and impacts of ML on creative professions. Harry has extensive experience in outreach to artists communities to produce collaboration and dialogue with researchers in computing, in both arts and computing venues. [13, 16, 17, 32] This experience extends to organizing panels and workshops and managing event logistics such as presenter travel, translation services, and accommodation for non-conventional conference attendees. From working in the intersection of art and computing, Harry aims to devise pathways of resistance, technical or otherwise, by stakeholders against the potential and observed harms from the production and deployment of machine learning systems.

William Agnew is a CBI postdoc fellow at CMU. William received his Ph.D. from University of Washington with Sidd Srinivasa, where he worked on AI ethics, critical AI, and robotics. William also helped found Queer in AI. William is interested in developing and sharing tools and ideas that go beyond participatory design and allow marginalized individuals and communities to own and meaningfully control their data and models derived from that data. Building on ideas from usable security/privacy, usage licenses, and indigenous data sovereignty, William wants to contribute to data and AI futures where individuals and communities know where their data is and can remove, add, or change their data in different datasets.

Tim Friedlander is a voice actor and the founder of the National Association of Voice Actors (NAVA)⁶. Tim is known for roles in *Hunter x Hunter*, *One Punch Man*, and the *Like a Dragon* series⁷. Through NAVA, he is also an advocate for workers in the industry, focusing on voice actors' rights to their voice and work. To that

end, Tim is active in political advocacy in the United States. In the face of the recent upheavals from AI, he and NAVA are proactive in engaging with the tech industry, promoting the principles of fair compensation, consent, and control of artists' works in AI systems. Tim has also engaged with the research community, both commercial and academic, and has helped organize venues for dialogue such as [17].

Zhuolin Yang is a PhD candidate in Computer Science at the University of Chicago who works on security implications of wearable devices, especially at the intersection of machine learning systems and wearables.

4 Panel Structure

Our panel will be hybrid to accommodate visa and time restrictions of panelists. We will make use of zoom and an owl microphone to ensure virtual panelists are able to engage effectively. We will also provide translation from Japanese to English and vice versa to enable panelists and audience members whose primary language is Japanese to participate fully. Our panel will last for 1.5 hours to accommodate translation times, and have the following structure:

- **(5 minutes) Introduction from the moderator**

- **(25 minutes) Presentation from panelists**

Each panelist will have time to give an overview of their or their group's work, how generative AI figures in their professional career, and give an overview of the impact of generative AI on their work.

- **(20 minutes) Directed discussion between panelists**

We will have prepared topics to ask the panelists as a group to answer and discuss or debate among themselves. This section aims to highlight differences in outlook between panelists as well as foster dialogue between the researchers and artists.

- **(40 minutes) Open Q&A and discussion** Much of the panel will be open for audience questions and discussion. Use and ethics of generative AI are a hot topic among the HCI community, so this section will be a forum for constructive discussion and debate grounded by the urgent needs of the working artists panelists, and the expertise of the critical HCI and security researchers on the panel.

From experience organizing the FaccT sessions, we believe this structure allows for extensive time for audience engagement and Q&A, allowing the CHI community to participate in this vital discussion.

5 Accessibility and Accommodations

Since we include both English and Japanese speakers in the panel, we will provide interpretation services on site. In addition to additional time to accommodate latency from translation, we would also have space for the translator to safely move between panelists and the audience. The panel will also allow capacity for A/V services to accommodate bilingual captioning in English and Japanese, for language and hearing accessibility.
