Abstract

The field of Human-Computer Interaction (HCI) both shapes and is shaped by the forces of economic growth. Extending the calls to move beyond the growth imperative in HCI, this workshop aims to bring HCI researchers, designers, and practitioners together in a critical dialogue on examining the often-hidden ways growth patterns manifest in HCI. We ask how the HCI community can use its research, design, and praxis to build a more emancipatory future. The workshop aims to nurture the *Post-growth HCI Collective* of scholars and practitioners to work together, in solidarity, to reflect and resist the commodification and drive for infinite capital accumulation in/through digital technologies for the betterment of HCI and the broader computing community. Through collective action, we aim to operationalize post-growth principles in HCI, contributing to more tangible pathways toward socio-ecologically just and sustainable technology-mediated futures for the planet and its residents.

CCS Concepts

• **Human-centered computing** → **HCI theory, concepts and models.**

1 Motivation

“In a world with finite resources, unlimited growth is a perilous illusion. We need bold, transformative change: drastically reducing overconsumption and waste, especially by the affluent ... reforming food production systems to support more plant-based eating, and adopting an ecological and post-growth economics framework that ensures social justice.”

–Ripple and fellow climate scientists (Oct 2024) [18]

Human-Computer Interaction (HCI) researchers are increasingly questioning the discipline’s embedded commitment to economic growth [2, 13, 15, 26]. In search of alternatives, many have turned to *post-growth philosophy*, which offers actionable pathways to build a society beyond the demands of unbridled growth [1, 14, 22]. To explore how post-growth ideas might take shape in HCI, we (some of the authors) organized and participated in a workshop titled *Post-growth HCI: Co-Envisioning HCI Beyond Economic Growth* at CHI 2024 [24]. This workshop sparked deep, enriching discussions,

highlighting the critical need for foundational conversations about the technologies we design and the underlying values they perpetuate. It necessitated challenging the ingrained, unquestioned “capitalist realism” [4], i.e., “the widespread sense that not only is capitalism the only viable political and economic system, but also that it is now impossible even to imagine a coherent alternative to it,” which has been guiding the trajectory of our field and the broader computing discipline. The workshop illuminated the urgency of rethinking HCI’s relationship with growth, pushing beyond the dominant paradigms to envision more just and sustainable futures.

Building on the previous workshop, our CHI 2025 workshop seeks to **critically examine the many (often hidden) ways growth patterns manifest within HCI and how we can use our research, design, and praxis to “build emancipation for tomorrow”** [26]. By bringing together HCI designers, researchers, and practitioners, the workshop aims to create a more concrete conceptual base to *co-reflect* on growth patterns in HCI and *co-devise* strategies to reshape their influence, paving the way for transformative post-growth HCI practices. It intends to contribute to the nurturing of a *Post-growth HCI Collective* of scholars across borders to work in solidarity, supporting each other, in challenging unjust and unsustainable narratives of growth in and through HCI.

2 Post-growth and HCI

The economy’s¹ relentless pursuit of growth has placed immense pressure on Earth’s finite resources, leading to a global meta-crisis² and massive economic inequality [5, 7]; though with some decline in overall poverty [17]. It is unsustainable for our economy to grow infinitely when the material resources it requires for its growth are finite [7, 9, 20]. In September 2024, the United Nations Pact for the Future declared the institution’s intentions to improve “how we measure human progress, going beyond GDP [a growth metric] to capturing human and planetary wellbeing and sustainability.”

Addressing critiques of growth, *post-growth* has (re)emerged as an alternative economy, prioritizing improving quality of life over relentless material accumulation. Instead of centering on unfettered growth, it nurtures cooperation, solidarity, care, justice, sharing, and leisure, among other values that cannot be reduced to material accumulation [5, 7, 8]. Post-growth envisions a society that (a) shifts production and consumption towards long-term ecological sustainability as the end goal, (b) prioritizes social justice and self-determination for a good life, and (c) reconfigures infrastructures to lessen their dependence on capitalist expansion [19]. Building such a society necessitates a transformation from growth to redistribution, from production to care, from accumulation to sharing, and from industrial development to context-specific, appropriate forms of development [7, 8, 19]—a society that serves the planet and its residents, now and in the future.

HCI researchers are increasingly emphasizing the need to embrace post-growth ideas in technology design [1, 12, 14, 22]. For example, Nardi [14] urged the HCI community that “[r]ather than letting circumstances become intolerable for billions, we should

take heart and listen to those telling us to slow down, to organize our lives around caring and conviviality, to intervene in processes of capital accumulation.” She suggested, “[t]houghtful people [post-growth proponents] have offered sound, reasonable alternatives, and, in my view, responsible design practice should act on them.” Scuri et al. [21] asked the HCI community “to identify the chains of the capitalist economy and to break free of them – ensuring that HCI research contributes to the design/creation of a new form of economic system that spurs the regeneration of our economies, societies/communities and indeed the biosphere that manages our climate.” Addressing these calls, Sharma et al. [22] suggested some actionable ways to formally orient HCI to post-growth. They recommended that HCI professionals cultivate economic literacy to evaluate the political and economic impacts of technological design, normalize the practices of redesigning and undesigning technologies, and nurture solidarity across geopolitical and more-than-human boundaries. They proposed the area of *Post-growth HCI*, inviting the larger HCI community to come together to “chart a more hopeful trajectory in which sustainability challenges have been rendered less turbulent and a solid foundation for justice has been laid, with intent, mediated through technology” [22].

Building on the momentum, our CHI 2025 workshop brings together HCI professionals to critically reflect on the many hidden ways growth patterns manifest within HCI and co-devise ways to pave the way for transformative post-growth HCI practices.

3 Organizers

We are a diverse group of HCI scholars conducting research aligned with the post-growth philosophy:

Vishal Sharma is a Ph.D. candidate in the School of Interactive Computing at Georgia Institute of Technology. His research in HCI examines the design and use of emerging digital technologies to nurture environmentally sustainable and socially just futures, with a focus on marginalized and minoritized populations.

Hongjin Lin is a Ph.D. candidate in Computer Science at Harvard University. Her research lies in the intersection of AI and social justice, critically examining the power imbalances in AI for social good partnerships and funding structures.

Asra Sakeen Wani is a Ph.D. student in the Department of Computer Science and Engineering at IIIT–Delhi. She studies the use of information and communication technologies in regions facing protracted sociopolitical conflicts.

Jared Katzman is a Ph.D. student in the School of Information at the University of Michigan. They use participatory design methods to investigate how communities want to govern the potential impacts of new technological innovations before a system is built.

Anupriya Tuli is a Digital Futures Postdoc at KTH Royal Institute of Technology. Focusing on health equity, she works at the intersection of HCI, global health, and taboo to understand and craft sociotechnical experiences that contribute to building just and equitable futures for all.

Naveena Karusala is an Assistant Professor in the School of Interactive Computing at Georgia Institute of Technology. Her research is on human-centered AI and health/wellbeing in underserved communities. She examines the design for more just care

¹Also referred to as the growth economy, industrial economy, capitalist economy, or capitalism.

²A convergence of interconnected and compounding crises affecting human society, the environment, and global systems. These crises are deeply intertwined and amplify one another, presenting complex challenges that demand systemic, holistic solutions.

infrastructures that better recognize the labor, autonomy, and rights of care workers and care recipients.

Shaowen Bardzell is a Professor in the School of Interactive Computing at Georgia Institute of Technology, where she is also the School Chair. Her recent research foci include care ethics and feminist utopian perspectives on information technology, women's health, and posthumanist and socioeconomic approaches to sustainable design.

Christoph Becker is a Professor of Information at the University of Toronto, where he leads the Just Sustainability Design lab, and author of *Insolvent: How to Reorient Computing for Just Sustainability* (MIT Press 2023).

Martin Tomitsch is a Professor and Head of the Transdisciplinary School at the University of Technology Sydney and a founding member of the Life Centered Design Collective. His research uses speculative prototypes to investigate how technologies shape people's interactions in cities and develop new methods and processes for responsible innovation.

Neha Kumar is an Associate Professor at Georgia Institute of Technology. Her research lies at the intersection of Human-Centered Computing and Sustainable Development, focusing on post-growth values of care, solidarity, and post-development.

4 Pre-workshop plans

Three months before the conference, we will set up a website. The site will feature the proposed workshop description, call for participation, and key dates. Additionally, we will review materials from the previous year, including accepted submissions, to serve as a repository of knowledge and resources, providing participants with valuable context and nurturing ongoing engagement with post-growth discussions in HCI.

We will advertise our workshop to a global HCI audience, leveraging all major platforms, such as mailing lists (e.g., CHI Announcements, Sustainable-SIGCHI), Slack workspaces (e.g., Sustainable HCI), social media channels (e.g., SIGCHI Discord, CHI Meta), and reaching out our participants from the last workshop. Coming from diverse geographical and disciplinary contexts, organizers will leverage their networks to advertise the workshop to targeted groups. Given the emerging post-growth sensibilities in HCI (see [1, 3, 10, 11, 16]) and based on the participation in our last CHI workshop, we expect at least 30-40 participants in attendance.

5 Submission Details

Participation in the workshop will require a 300-500 word reflection piece in single-column ACM template format on how the concept of growth manifests in HCI or their work; growth, for example, may be reflected in pressures to publish more papers, use larger models, or rely on bigger datasets. We encourage participants to define and explore different concepts of growth as they relate to their personal experiences and perspectives. In addition to the reflection, we invite participants to submit an artifact—a photograph, poem, excerpt, or rough pencil sketch, among others—with a small description of what post-growth does or does *not* look like or mean or does *not* mean to them. These artifacts will be showcased in an interactive *post-growth gallery* at the start of the workshop.

Submissions will be accepted through a form on our workshop website, which will remain open until February 13, 2025. The organizers will evaluate submissions based on their relevance to post-growth, diversity of perspectives, and potential to spark critical discussions. We strongly encourage and will prioritize submissions from scholars traditionally underrepresented in HCI due to aspects of (including but not limited to) race, gender, institution, and geography. Applicants will be notified of their selection via email by March 1, 2025.

Accepted submissions will be shared with all participants via the workshop website at least six weeks before the event. To nurture early engagement, we will invite participants to join our existing Slack workspace, where discussions can take place in the lead-up to the workshop. We will also provide key resources through the Slack channel and workshop website, including the *Post-growth Human-Computer Interaction* paper [23] and other relevant works on post-growth (e.g., [1, 14]), ensuring that participants have a shared foundation on post-growth concepts as they relate to HCI.

6 Workshop Format

The workshop will follow a hybrid format, conducted in *three phases*: an online session (60-90 min) prior to and after the on-site session. The online sessions will take place at least a week before and after the on-site one.

Building on insights from our CHI 2024 workshop [25], we understand that discussions around (post-)growth require deep, critical, and sustained philosophical engagement with research practices and values, both at the community and individual levels. The online sessions will be kept open-ended to familiarize participants across different time zones with post-growth principles. During the pre-workshop session, participants will be encouraged to start reflecting on how growth patterns manifest within HCI. These reflections may surface challenging questions regarding personal values, ethics, and the impact of their work. To allow space for this contemplation, we will provide time before reconvening for the on-site session, which will build on and extend the online discussions. The post-workshop sessions will offer a space to reflect on the conversations we had and discuss the next steps, including co-writing a workshop proposal for CHI 2026.

While each session will be self-contained, they will remain in dialogue with each other, ensuring that participants can engage meaningfully by attending either or all components of the workshop. To facilitate collaboration during the virtual session, we will use a shared Google document where participants can add notes and comments that will be discussed during the in-person workshop. Organizers will handle logistics such as note-taking, timekeeping, and documentation throughout the workshop. For the on-site session, a student volunteer will assist with capturing notes, photos, videos, and recordings of workshop activities—ensuring all necessary participant consent is obtained in advance. The online sessions will support greater participation from people across time zones and those concerned about the environmental, financial, or other costs of travel.

Time (JST)	Duration	Activity
09:00–09:30	30 min	Welcome, introductions, and workshop agenda
09:30–10:00	30 min	Post-growth gallery
10:00–10:30	30 min	Break
10:30–11:45	75 min	Artifact presentations & growth categorization
11:45–13:15	90 min	Lunch and group set up
13:15–14:15	60 min	Conversation café
14:15–14:45	30 min	Break
14:45–16:00	75 min	Zine-making activity
16:00–16:15	15 min	Break
16:15–17:00	45 min	Final reflections, next steps, and zine trade

Table 1: This is a tentative workshop schedule. We will be prioritizing breaks throughout.

6.1 On-Site Workshop Structure

The in-person workshop session will span 8 hours to give participants time for breaks, reflection, and re-engagement with the activities. These periodic breaks will also allow the organizers to adjust upcoming activities in response to any practical constraints that may arise. The key workshop activities are:

Welcome greetings, introductions, and agenda (30 min): The workshop will begin with a welcome from the organizers, followed by participant introductions. We will then outline the workshop agenda and provide a brief introduction to post-growth ideas, framing it around the central question: *How does growth manifest within HCI?* This introduction will help ground participants in the workshop’s goals and set the stage for active engagement in the activities that follow.

Post-growth gallery (30 min): All submitted artifacts (along with the descriptions) will be printed and displayed in the room. Participants will walk around and view/engage with the submitted artifacts, using Post-it notes to leave comments. Doing so will generate some discussion and reflection; because of their standpoint/situatedness [6], people may view an artifact’s engagement with post-growth differently.

Artifact presentation & growth categorization (75 min): Participants will be divided into small groups of 4–6 individuals. Each person will have about 2 minutes to share their reflection piece and/or present their artifact. This activity aims to facilitate the generation and discussion of concrete examples of growth patterns within HCI. Following these presentations, each group will work together to categorize the growth and post-growth patterns identified in their discussions. Groups will then share their categorizations with the larger audience to spark conversations.

Conversation café (60 min): Each table will be assigned a conversation topic focused on the necessary changes within HCI. These topics will be informed by discussions from the previous workshop and the themes emerging from participants’ submissions. Possible topics may include: a) envisioning a syllabus for HCI educators that incorporates post-growth lessons, b) proposing the next workshop on Post-growth HCI at CHI 2026, c) exploring coalition-building with other professions and subfields within HCI aligned with post-growth, d) developing new funding models for post-growth research, and e) proposing changes to ACM conferences and academic norms relating to post-growth. Participants

will have the freedom to choose which conversation table to join or propose new ones, while organizers will strive to keep groups evenly distributed (with possible caps on group sizes based on participant numbers and topics). Each group will work collaboratively on a dedicated Google document and collectively decide on roles such as facilitator and note-taker.

Zine-making activity (75 min): In each group, participants will collaboratively design a simple zine that reflects the themes discussed during the conversation café. To inspire creativity, we will provide colorful craft materials and prompts tailored to each conversation topic (e.g., “Create a zine on The Six Concepts Computer Scientists Need to Learn About Post-Growth”). Each group will have approximately 15 minutes to present their zines, fostering cross-group dialogue and feedback after the workshop. If feasible, the workshop organizers will collect the zines at the CHI venue and create both digital and physical copies for groups wishing to distribute them.

Final reflections, closing, and zine trade (45 min): We will wrap up the workshop with a reflective session on our experiences, discussing key takeaways and outlining the next steps (to be discussed further in the post-workshop session). The organizers will present a synthesis of the results from the morning’s HCI growth categorization activity. Following this, we will collaboratively explore potential follow-up activities, collaborations, or initiatives that can build on the insights gathered throughout the workshop. Participants will be encouraged to share their ideas for future actions and developments. After this discussion, we will invite participants to “trade” their zines, fostering further sharing of lessons learned from previous activities. Lastly, we will end by hosting an informal networking event, providing attendees with the opportunity to reconnect and engage in open discussions on various topics related to HCI, post-growth, and other relevant areas.

7 Post-workshop plans

Following the workshop, we will collaborate with interested participants to distribute their zines (and copies) in physical and digital format (e.g., via a QR code) at the conference and beyond. After the event, we plan to synthesize the insights and open questions generated during the workshop and publish an article in ACM Interactions, Computing Within Limits Workshop, and/or a blog post on Medium. Based on the submissions and the engagement

of participants—through comments, critiques, and suggestions related to post-growth ideas—we aim to organize a special issue in an HCI journal (e.g., TOCHI), inviting workshop participants and others to contribute submissions that will advance the conversation around post-growth in HCI. Participants and organizers will utilize the Slack channel established during our previous CHI workshop to share research on post-growth and collaborate within the Post-growth HCI Collective. We will organize a post-workshop session to offer a space for our workshop attendees to reflect on the conversations we had and discuss the next steps.

8 Accessibility

Before the workshop, we will reach out to participants to understand how we can best support their involvement. A brief questionnaire will be distributed through the Slack channel and via email, inviting participants to share their needs to facilitate their desired level of engagement. Our online session will ensure accessibility for individuals across different time zones not attending the conference in person due to environmental or financial reasons.

9 Call for participation

This hybrid workshop in three phases—online sessions (90 min) weeks prior and post to an on-site session—seeks to advance conversations around Post-growth HCI by inviting researchers, designers, and practitioners to *co-reflect* on the impact of growth patterns in HCI and *co-devise* strategies to resist their influence. Sessions will be self-contained but in dialogue with each other, ensuring that participants can engage meaningfully by attending either or all components of the workshop. The online sessions will support greater participation from people across time zones and those concerned about the environmental, financial, or other costs of travel.

We encourage interested participants to submit a 300-500 word reflection in a single-column ACM template on how growth manifests in (or in their work in) HCI, along with an accompanying artifact (e.g., a photograph, poem, excerpt, or rough sketch) that illustrates what post-growth means or does *not* mean to them. Submissions should be made by February 13, 2025, through the form linked on our workshop website. Workshop organizers will evaluate submissions based on their relevance and potential to generate critical discussions. Accepted submissions will be shared on the workshop website. All participants must register, and at least one author from each accepted submission is required to attend either the online or on-site sessions.

This workshop is an effort towards nurturing the *Post-growth HCI Collective* of scholars across borders, working in solidarity to challenge unjust and unsustainable growth narratives, and collaboratively envisioning a post-growth future in HCI and computing more broadly. For more information and the submission form, visit the workshop website: <https://bit.ly/4gBS6Ys>

Acknowledgments

We extend our gratitude to the post-growth community for illuminating a path away from unsustainable and inequitable economic growth. Our work is dedicated to scholars, advocates, and activists spanning generations and geographies, within and outside HCI,

who have been instrumental in the theoretical and practical development of the post-growth philosophy. Their efforts have nurtured a space and time for us to discuss subversive alternatives centered on climate-conscious, decolonial, and post-capitalist narratives. We thank all who participated in the conversations leading to this workshop proposal, and our reviewers for feedback.
