Abstract

Although IoT devices are becoming increasingly prevalent in our living spaces, their integration into daily life often remains rudimentary. This video explores a novel concept of transforming everyday objects into intuitive interfaces for controlling IoT devices in smart environments. Through a scenario movie titled 'A Day in the Life of Peter', the video illustrates a speculative user experience where various types of everyday objects enable seamless IoT coordination. Grounded in 11 representative cases derived from our prior research [1, 2], the video showcases potential use cases and highlights both the opportunities and challenges of utilizing everyday objects for IoT interaction. By reimagining non-digital artifacts as meaningful components of future IoT ecosystems, this video aims to inspire fresh perspectives on IoT user experiences and foster discussions on creating more engaging, personalized, and diverse smart environments.
