ABSTRACT

As a form of electrotactile artificial organ, what kind of immersive experience can MR technology provide?

Revoc is "cover" spelled backward, symbolizing the liberation of electro-tactility. Data.Revoc liberates the audience's perceptual abilities through microcurrents, visualizing the relationship between electrotactile sensations and sound using MR technology.

1 INTRODUCTION

Positioned within the intrusive yet non-invasive space of the oral cavity, it realizes an Eastern cyborg experience, challenging the human essence defined by Eight Consciousness of Buddhism. This immersive journey unfolds as an Audio Reactive + Electrotactile fantasy, expanding the biological identity of the audience and revealing that the path to cognitive enhancement is a journey beyond enlightenment.

It invites participants to transition from being human to embracing the realm of non-human, nondivine, and non-Buddha—a realm of Electrotactile Asura.

2 ARTISTIC CONTEXT

"Must humanity remain human?"

The Human-like Non-human Series emerges from the intersection between "cognitive algorithms of surveillance capitalism" and "cybernetic organisms," and explores how the nature of "I" is shaped by the interaction between the natural algorithm intrinsic to the human brain and artificial algorithms.

Lai Jiun-Ting, through the interactive wearable device known as the "Second Organ of Electrotactile Perception," liberates the human perceptual capacity with a subtle electric current—it is a way to demonstrate how technology as an artificial organ can enhance human cognition in terms of grasping the limits of information as well as expanding, shaping, and even manipulating the boundaries of human biological identity, engaging in a realm of hybrid artistic

experimentation where an essential question arises: "Must a human be human, yet also resemble something non-human?" The series of artworks delves into the realm of reactive implantable technology to manipulate the audience and draws inspiration from Eastern philosophical notions emphasizing cognitive expansion, thus contributing to the "Transhumanism Movement."

With the view to proposing an opposite point of view to Western cyborg perspectives rooted in taxonomy and microelectronics politics, this series also deals with the contradiction and illusion of the human brain as a predicting machine, offering new insights into the intricate relationship between "human," artificial evolution, and algorithmic technology.
