ABSTRACT

In this paper, we contribute three design manifestos that start from our queer, crip experiences to resist dominant designs and practices of productivity. Through our manifestos, we explore tensions in glitching three technologies of productivity (Mendeley, Figma, and ChatGPT) by reorienting their intended uses and design scripts. By sharing our perspectives and design processes, we invite new ways of relating to technologies of productivity, offer design provocations for queering and crippling technologies in HCI, and call for building intersectional coalitions that contribute towards a slow, non-linear resistance.

CCS CONCEPTS

• **Human-centered computing** → **Human computer interaction (HCI)**.

KEYWORDS

queer, crip, intersectionality, manifesto, productivity

1 INTRODUCTION

The ideals of productivity and efficiency are embedded in our culture, rhetoric, and infrastructures [39], as evident in academic practices [73]. These ideals are also apparent in technologies of productivity, tools designed to increase efficiency in completing tasks, thereby improving individual and organizational productivity. Technologies of productivity encompass a broad range of applications and devices that help streamline workflows, organize tasks, and automate processes, among others, reinforcing ideals of productivity inherent in our cultures. Queer and Crip theorists have illustrated

how this culture of productivity signifies a “schedule of normativity” [43] and reinforces ableist, heteronormative, and patriarchal structures [69], collectively calling for a reevaluation of what we value as productive.

In this paper, we contribute three design manifestos that offer critical questionings of digital technologies from our respective queer and disability perspectives. We frame them collectively as an “un-manifesto,” following Howell et al. [62], to signify their plural yet intersecting voices. In their creation, we queer/crip three respective technologies of productivity through their very forms, challenging the cultural practices of these technologies by working with and beyond their affordances and breaking out of their design scripts. In doing so, we also respond to Hanna et al.’s call for critical and creative manifestos that provoke instead of promote [47].

Specifically, Sylvia crafts a manifesto through Mendeley, a citation manager for organizing and annotating academic references, as a critical and reflexive synthesis of provocative crip readings that reflect her own lived experiences with chronic illness, which stands in opposition to productivity-minded academic and design practices. Alexandra (i.e., Allie) crafts a manifesto through Figma, a technology for rapid design prototyping, as a multi-sequential interactive narrative that disrupts normative chronologies to reflect a fluid and reflexively messy form of queer resistance. Abigale (i.e., Abby) crafts a manifesto through ChatGPT, a language based AI model, through prompt-based reflexive dialogue, to demonstrate the transformative interdependent power of AI-in-the-loop assistance for dismantling the access burdens of writing with ADHD and dyslexia, and provide new training data for ChatGPT to be an agent of crippling and queering.

Our collective un-manifesto offers examples of creatively repurposing technologies to resist dominant designs and practices of productivity from within, foregrounding alternative possibilities in design and scholarly spaces. At the same time, we acknowledge our entanglements within these systems of productivity and our messy relationships with these technologies as both supportive and problematic. By sharing our perspectives and design process, we invite new ways of relating to technologies of productivity, offer design provocations for queering and crippling technologies in HCI, and call for building intersectional coalitions that contribute towards a slow, non-linear resistance.

1.1 Coalition Formation and Positionalities

We created a coalition (between A1, A2, and A5) to explore possibilities of doing critical, collaborative, and intersectional work in

design while also building a supportive space for reflexive, slow scholarship. We started by centering our own positionalities and bringing together our respective experiences with queerness, disability, and illness. We met weekly to share new progress in our scholarship, and we also shared personal stories. We explored the language of design manifestos to reflect on our personal relationships to design, technologies, and research, to position ourselves within critical design space, but also as a way to get to know each other and find opportunities for collaborations.

Here, we detail our positionalities and experiences with queerness, disability, and illness that drive our scholarly interests in critical theory within HCI design spaces. Sylvia is a design researcher exploring critical design methods for, with, and from chronic illness. Her work draws from feminist and disability theories as well as her own experiences of illness to explore intersectional, political, and relational approaches of designing for access. Allie is a queer and gender nonconforming researcher and former industry experience (UX) designer. Their research is concerned with how we might queer digital technologies, using both emerging research in Queer HCI as well as queer archives scholarship to explore how we relate to technology through a queer lens. Abby, an interdisciplinary research scientist, informs the design and training of multimodal content creation practices and technologies for accessibility and expression. Her path emerged through persistent acts of queering and crippling her learning environments to accommodate herself as a neurodiverse scholar. Noura is a cis woman, able-bodied, queer- and crip- allied researcher, white and Middle Eastern, with a middle-class family upbringing in the United States. Anne is a gender non-conforming (she/they), queer, white, disabled, researcher, who is a first-generation college student from a lower-class upbringing in the United States. These perspectives inform our research, design directions, and the feminist, intersectional practices central to this project.

2 BACKGROUND

To position the design approaches and theoretical orientations that underlie our collaborative project, we highlight feminist epistemologies and critical scholarship from queer and crip perspectives. We also highlight HCI scholarship that has engaged with these ideas to challenge productivity as an ideal.

We center our work on the notion of reflexivity that encompasses a practice of self-questioning and a recognition of social positions [49]. Starting from our own lived experiences, we bring together our partial yet situated knowledges for collective understandings [48]. We highlight concepts around interlocking views of oppression [22] and intersectionality [24] that describe how different axes of discrimination, such as race, gender, class, religion, and ability, can intersect in experiences of oppression. We further draw upon HCI scholarship that has put forth feminist design methods and agendas in the context of computing [7, 8, 93]. Together, these works provide a way of examining how social structures and power dynamics are entangled with our experiences and embedded within our technologies.

2.1 Queer and Crip Theories

Our positions motivated us to explore intersections in queering and crippling technologies to challenge normative modalities. Our work is inspired by disability and queer scholarship that resists the categorization and essentialism of “normal embodiment” [107], foregrounds “glitching” as a tactic of noncompliance [98], and elevates alternative temporalities that counter cultures of productivity.

2.1.1 Queering and Crippling Design. We refer to Harmraie and Fritsch’s definition of crippling as an active resistance against compliance with normal embodiment and desired futures that harnesses technoscience for political action [46]. Crippling attends to the “intersectional workings of power and privilege” to “agitate against independence and productivity as requirements for existence” [46, p2]. We further draw upon bell hooks’ definition of queerness: “‘Queer’ not as being about who you’re having sex with (that can be a dimension of it); but ‘queer’ as being about the self that is at odds with everything around it and that has to invent and create and find a place to speak and to thrive and to live” [58]. To queer, then, is to resist categorization, thus facilitating, as Keeling notes, “uncommon, irrational, imaginative, or unpredictable relationships” [71, p154] between beings and their environments.

In crippling design, critical disability scholars have collectively pushed against the idea of “technoablism,” which describes ways in which technologies are being developed to cure or fix disability [104], in turn enabling inaccessible designs and ableist rhetoric. Instead, they highlight disability as intersectional, fluid, unstable, and socially constitutive [35, 69], and invite new ways of engaging with and designing technologies that emphasize the values of interdependence, relationality, and care in building access [10, 46]. HCI scholars have built on disability studies as a source of critical inquiry for designing assistive technology [84, 110], imagining accessible worlds [4], and reframing access beyond technological terms [12, 56]. We build on these understandings to imagine alternative crip relationships to digital technologies.

When queering digital technology, scholars have proposed tactics that seek to subvert heteronormative design practices. These are evident in works of Queer HCI, which is concerned with research by queer individuals, research about LGBTQ+ people, and research that leverages queer theory [111]. Building from queer theory specifically, scholars from Queer Games Studies and Queer HCI have emphasized the importance of “failure” as a practice [44]. Queer theory scholar Jack Halberstam highlights the notion of failure as a lens through which to critique the capitalist system, which values productivity, conformity, and traditional notions of success [44]. In HCI, failures have also been explored as sources of insight [36], a means of cultivating resiliency [112], and a way of attending to “messy unfoldings” that break away from linear success narratives [61]. We draw from these ideas to resist hegemonic narratives of productivity.

2.1.2 Queering / Crippling through Glitch. In digital technologies, failures can take form through “glitches” that reveal structural assumptions and systemic biases [9, 98]. “Glitches” can also transform digital technologies by subverting their computational forms

[33, 78, 91, 98]. Light names characteristics such as “cheating, eluding, and obscuring,” which signify opting out of, hacking, or inserting elements of randomness and alternative possibility into normative systems [78]. These characteristics describe tactics for glitching, which offer an alternative engagement with the technological medium, employing failure in an “unexpected transformation in the function of computational devices” [33, p485]. In doing so, we “imagine new ways to work against the normalizing influence of our technical culture while maintaining the general functionality of the systems we inhabit” [33, p490]. In crafting our manifestos, we draw from these scholars to work within existing technologies to subvert, resist, and create “fuzzy logic” [78], breaking out of their standard uses for productivity with glitches that start from our queer/crip bodies.

2.1.3 Queer / Crip Temporalities. Our work further reflects writings on crip and queer temporalities that resist linearity, causality, futurity, and “normative narratives of time” [43]. These notions of time also counter its commodification into a measure of productivity under capitalist logic. In Disability writings, crip time pushes against the pace of contemporary industrialized life [54] and “bends the clock to meet disabled bodies and minds” [69, p27]. For example, Forlano describes crip time as entangled with every day rituals, denoting a “slowing down” and “disruption” of daily routines [29]; Samuels describes crip time as a kind of time travel, “[extracting] us from linear, progressive time with its normative life stages” [101]. These temporal relationships invite alternative logics and orientations beyond productivity ideals.

Queer time similarly resists notions of “progress,” “futurity,” or “chrononormativity” by experiencing time alternatively [31]. Queer time slows down the “speed at which digital networks operate” [85] and calls attention to alternative arrangements of time, bodies, pleasures, and histories [31]. Applying queer temporalities to Queer HCI and computing, Light characterizes “design for forgetting” as “designing against the strengths of computers to store everything indefinitely” [78, p434]. These queer temporalities rework the systems of fixity, progress, and linearity that characterize technologies of productivity, as shown in our collective un-manifesto.

Here, we also highlight HCI scholarship that has pushed against productivity as an ideal. The third wave of HCI moved from emphasis on utility and efficiency to embracing experience and meaning-making through design [14]. Scholars laid out design agendas that invite provocation, reflection, and challenging cultural assumptions [6, 102]. These include engagements with different temporal experiences [37, 92], designs for slowing down [40, 88, 89], and specific design experiments that repurpose productivity tools to do less instead of more [57, 76]. Scholars have also aligned with feminist and critical computing commitments to confront value systems of productivity and usefulness in HCI [79]. These prior works lay a foundational pathway for challenging productivity in HCI, but we identify more work to be done, particularly in intersectional, queer / crip approaches, to resisting the ideals of productivity.

2.2 (Un-)Manifesto as a method

Manifestos can provide designers with a way to reflexively express particular standpoints, serving as declarations or provocations upon which to build design philosophies, stake claims, or

collaboratively relate across ideological vantage points. We build on calls of other manifestos that resist normative or extractive design and data practices in HCI spaces [1, 3, 21, 34, 80]. For example, Cifor et al. present the Feminist Data Manifest-No as a declaration of refusal and commitment against harmful data regimes and commits to new data futures [21]. We especially highlight manifestos that elevate disability perspectives [27, 46, 86] and center queer experiences [23, 98], which, together, underscore intersectional experiences of oppression and call for designs for collective liberation and justice. We frame our work in line with Howell et al.’s approach of “un-manifesto” that pushes against the singular voice in western traditions to foreground diverse positions and cultural perspectives [62]. In accordance, we share our perspectives as a collective of voices that intersect in some places and differ in others, through which we critically challenge dominant technocentric practices through our respective storied positions. We specifically respond to Hanna et al.’s call for manifestos that are critical and creative as opposed to “reactionary or merely programmatic” in the presentation of our manifesto collective [47]. As such, we push back on the traditional, linear, authoritative form of manifestos. Instead, we craft each manifesto through non-linear reflection and provocation, by glitching existing technologies of productivity, highlighting their forms and creation processes as integral to their messages.

3 THREE MANIFESTOS

We share three design manifestos and our process of crafting them. In their creation, we each employed a specific technology of productivity (Mendeley, Figma, ChatGPT) that represents our scholarly/professional work, or our orientations to “productivity.” Each author uses a different format to present their manifesto, reflecting their respective technologies in form and design. Through these engagements, we highlight tensions in our relationships to technologies as scholars working at the intersection of HCI, design, and critical theory. In the following sections, we each start by sharing our relationships to the specific technologies of productivity we engage with, our processes of queering/cripping them, followed by the manifesto itself. Each section will be narrated in the first person singular “I” by its author.

3.1 Crippling Mendeley by Sylvia

What might it mean to crip technologies of productivity, such as Mendeley—a reference and citation tool?

As a Ph.D student, I spend a lot of time collecting, reading, organizing, and analyzing literature. I engage with these texts through Mendeley, a citation manager that organizes research materials and streamlines citation processes. Mendeley is designed for efficient workflows: It supports systematic categorization of texts through metadata, marking and linking files through tags, analytical reading and annotating, and mechanically exporting formatted references. Mendeley is one of the most used softwares in my work—the main piece of technology that drives my productivity output.

In the past few years, I have engaged extensively with feminist and disability readings (using Mendeley, of course). Many of these texts are powerful writings that I relate to on an embodied level; reading them can evoke a range of feelings and emotions. Over time, my collections of marked-up papers in Mendeley have not

Figure 1: Sylvia’s Manifesto in Mendeley is a critical and reflexive synthesis of disability scholarship that explores possibilities for design that start with chronic illness experiences. The categories/folders on the left are key themes in disability writings that Sylvia has experienced or relates to from living with chronic illness. The middle section lists these writings and their authors. Notes on the right show a personal reflection on these themes (underlined) referring back to the texts.

only become a treasured archive of knowledge and markers of my intellectual growth, but they have also come to represent an alternative form of healing—a digital apothecary that restores, rejuvenates, and invites new possibilities of living with illness.

In thinking through my ambivalent relationship with Mendeley, I ask: How could I disrupt the linear, mechanistic and analytical annotations and categorization of references in Mendeley? How can it account for my intimate relationships to these writings, document the emotions they evoke, and allow me to insert my own narrative into the export?

Through Mendeley, I crafted a manifesto (section 3.1.1) that reflects my personal entanglements with these references: I categorize them in relation to my embodied experiences, annotate them through emotional reflections, and narrativize them through descriptive notes and critical questions. I use folder structures in Mendeley to thematically outline my manifesto, creating keywords for each main theme and placing relevant references in these sub-folders. I use annotation tools to express my emotional connections to passages within each text. I work through these emotional tags in the general notes section, where the body of my manifesto was first written (Figure 1). Through this, I make messy connections across writings, find scholarly allies and coalitions, and discover

new possibilities of working with Mendeley that reflect feminist, queer, and crip ways of knowing while inviting new ways of engaging with digital technologies and their surrounding practices that elevate experiences of illness.

3.1.1 It’s Time for a Break: A Manifesto on Designing for Slow Resistance. Part 1: On Medicalization and Control

I’m tired. Maybe it’s because of my chronic illness — But I’m also tired of looking for answers to what is “wrong” with my volatile body [2, 41] — Of speculating on what is making me sick this time [64]: was it the something in the air [67]? Was it something in the water [83]? Or was it something in a product I used [113]? — I’m tired of the blood tests that can’t seem to detect my discomforts [15] — Of reliance on biodata as an “objective” measure of normalcy [70] — I’m tired of medical practices that use these technologies for credibility of my lived experiences [26] — Of evidence-based approaches that dismiss the possibility of missing evidence [51] — I’m tired of people telling me to “track my symptoms” [25] — As if with this data I could find the single culprit in the complex entanglement of chronic illness [109] — *How can we let go of the need to control our bodies and embrace their unpredictability? Let us design for bodily disruptions as a way to disrupt the desire for control and certainty.*

Part 2: On Productivity and Pace

I'm tired. Maybe it's because of my chronic illness — But I'm also tired of the obsession with movement and productivity [39, 103] — Of tracking apps and pacing technologies meant to optimize: to make us stronger, faster, more productive [108] — Of the “active designs” that actively exclude people who move slowly, differently, or less [42] — Why should I move when what I need is rest [55]? — But how can I rest when I am expected to produce: to teach, and design, and write, and research, to publish or perish [73] — How can I rest when there are no places to lie down when I leave my house [72, 96]? — Would it be weird if I laid on the ground? On the park bench [95]? On the carpeted floors of the library [94]? *How can we slow down the pace of our environments, both built and cultural? Let us design for inactivity, for pause, for breaks as a way to break from the expectation of productivity.*

Part 3: On Independence and Automation

I'm tired. Maybe it's because of my chronic illness — But I'm also tired of pretending to feel okay [100] — Of pretending that I don't need help — I'm tired of the suggestion that we don't need other people, or people at all [104] — Independence, autonomy, automation — I'm tired of machines that replace human interactions while automating inequality against marginalized bodies [28] — Like automatic ticketing machines that create more problems for people with disabilities in the name of efficiency [114] — I'm tired of the rigid practices that cannot make sense of disabilities that are changing, dynamic, situational, or invisible [35, 69] — Of the individualism that makes us forget that we are all interdependent [46] — That access is not just about designing to accommodate individual needs [45] — But also about being together and caring for each other [10, 12, 30]. *How can we reorient our collective responsibility of living together in a shared space? Let us design for access by building relational capacity, social support, and care.*

Part 4: Starting from Chronic Illness

What would technologies look like or feel like if we began with sensitive [68], slow [20], and glitchy [29] bodies? Can biosensing technologies help us relate to others and see our bodies as interconnected instead of individually bounded [63, 66]? Can environmental sensing be calibrated to our breathing spaces, our hearing spaces, or our feeling spaces [13, 81]? Can assistive technologies also be social signals or interfaces [105]? Can they help us ask questions, challenge assumptions, and not just solve problems [52]? Can we use pacing technologies to do less instead of do more [57]? Can smart city infrastructure support different bodies and temporalities in the city [53]? Can automation account for unpredictable glitches [60]? Can spatial data practices account for shifting relational processes of place [19]? *What might we learn if we design from chronic illness? Let us design beyond control, productivity, and independence. Let us start a slow resistance.*

3.2 Queering Figma by Allie

What might it mean to queer technologies of productivity, like Figma—a popular software UI design tool?

Working as an Experience Designer for nearly a decade, my colleagues and I became used to the kind of software fluency that can only be achieved under intense pressure and repetition. Figma, the latest and most powerful in a line of design tools (compared to the

likes of Adobe Illustrator, Photoshop, and Sketch), was not only a piece of software, but an environment within which we communicated and carried out our work lives. Within that space, we were constantly faced with a mandate: create the highest possible quality work in the shortest amount of time. In this crunch, the design process often became linear, less collaborative, less iterative, and less creative. Returning to Figma to write an interactive manifesto, or “manif-mess-to” as I call it, feels like a resistance to the years I spent toiling in these productive modes. But it also feels like a failure: I have failed at a “successful industry career,” I have failed to make it as a commercial designer [44]. Not only that, my manifesto, and thus my “failure” feels “unfinished” and forever growing, purposefully sideways [44, 82].

To queer or cripple Figma, I used its design and prototyping features to create an interactive narrative (link), rather than my usual gray boxes for a client presentation (Figure 2, Figure 3). By using Figma for storytelling that evades linearity, I create a brief temporal confusion. I “fail” or queer with Figma, using it to communicate my own insecurities around queerness, gender, design, research, and even industry. My interactive narrative, entitled “Queer Manif-mess-to” asks more questions than it answers, centering around the topic of what it means to “design something queerly.” These questions link to branches of the narrative that offer ideas but never certainties: “glitching,” “messing with time,” “finding the feelings, finding our bodies,” “designing in-between,” “designing with others,” “designing as protest,” “designing with queer symbols.” Each of these narrative offshoots not only questions what it means to queer design, but includes stream-of-consciousness reflections on my own feelings, questions about gender and sexuality, and personal anecdotes that undergird my academic provocations. Through the multisequential [87] narrative structure of the “Manif-mess-to,” I create a messy abundance [78] that queers not only the form of the manifesto, but also Figma itself.

Reflecting on my work, I could queer it further: I could create glitchier aesthetics, I could write a script to break Figma itself. But these modes all reify the tension of the glitch: as its aesthetic proliferates, its effect is dampened. Creating a glitch-like visual would only use and reproduce Figma's existing aesthetics without radically reimagining it. Writing a script to break the software would only break my own copy, leaving the productive, capitalist structures in which the software is embedded untouched. Even in imagining how to queer Figma, I am caught in the cycle of how “glitch,” “failure,” and even queerness itself become commodified and ingested back into the structures of progress and productivity. My own work could be turned into a marketing ploy or a digital ad or a brand campaign that paints queerness as a cheeky youthful hook. Even more so, I feel the tension in creating and writing for publication, which is itself a productive endeavor. Instead, I wonder how to move beyond glitching. How can I instead use a technology of productivity for queer coalition forming, for storytelling, for reflection that resists commodification? Thinking through this, it has been helpful to consider Twine and RenPy, both authoring tools for interactive digital narratives that afford queer storytelling, sharing, and community building [99]. These tools and communities represent acts of resistance against the hegemonic power of the games industry, in the same way queering design software could. While Figma is neither a tool “on the margins” [99] nor embedded

Figure 2: Allie's Queer Manif-mess-to: an interactive narrative in Figma that asks what it means to design something "queerly," offering uncertain, abundant, and fluid personal reflections on productivity, failure, and queer theory in design. Figma is used more typically for creating UI for web or mobile interfaces. Here, Figma's prototyping mode shows blue arrows that link from one text box to another, creating an interactive narrative when the prototype is shown in the browser (link). For accessible figma prototypes, follow this guide (link) to activate accessibility mode.

Figure 3: A close-up of Allie's Queer Manif-mess-to themes, as they work through what it means to design something queerly. Perhaps queering is glitching, or messing with time, or finding the feelings, or designing in-between, or designing with others, or designing as protest, or designing with queer forms. The Manif-mess-to refuses to define, categorize, or answer any questions, instead offering personal reflections and provocations in messy, liminal passages.

in queer game-making communities, perhaps we could use it for queer expression and coalition-forming. Perhaps these endeavors encourage queer creators to use technologies of productivity for storytelling that is decidedly “unmarketable” or for collaboration that is purposefully unproductive, playful, and radical.

3.2.1 Queer Manif-mess-to. The Queer Manif-mess-to is an interactive and visual narrative represented in figure 2 and figure 3. You can also read and interact with it in your browser through this [link](#). To activate accessibility mode in Figma, which makes the prototype compatible with a screen-reader, follow this [guide](#).

3.3 Reflexivity via ChatGPT by Abby

What might it mean to use ChatGPT, an advanced language generation model, as a tool to support reflexivity on living with ADHD and dyslexia?

A month before completing my PhD, I was formally diagnosed with ADHD, though the persistent exhaustion from managing cycles of executive dysfunction along with dyslexic spelling and shame were all too familiar. While periods of intentional rest between deadlines had provided time to “catch-up”, gaining the diagnosis of ADHD initiated a slow process of re-calibrating my view as a learner and what it means to be productive member of society. During this reflexive experience, ChatGPT was released by OpenAI, and I wanted to explore the functionalities. Though my work centers on ethically developing AI-based assistive technologies, my first interaction began as an unexpected surprise. I asked questions to understand the effects of dyslexia vs. ADHD on my workflow, and I thought through how I might queer and cripp my current approaches. In asking these questions, I observed how the natural language processing abilities of ChatGPT enabled me to fluidly make connections between nonlinear thoughts and communicate without embarrassment. Automated interpretation and correction of my spelling-mistake-riddled content, along with on-demand answers to my questions about ADHD, dyslexia, migraines, and other forms of stress-based chronic pain, initiated a new act of disentangling internalized oppression, which had been formed through years of ablest expectations for a normative path and pressure to perform and meet the demands of the publish or perish academic mindset.

The manifesto below reflects this newfound relationship with ChatGPT as a co-author. Guided by my content knowledge, critical thinking, and iterative prompting design [18], ChatGPT and I explore how reflexivity and retraining through crippling and queering can yield alternative futures. Table 1 shows exemplar prompts I used to write the following manifesto, beginning with: *ChatGPT, let's write a manifesto that can be used in a dataset for queering and crippling ChatGPT.*

3.3.1 A Manifesto for Queering and Crippling Productive Writing and ChatGPT with ChatGPT. We envision a transformative path where Abby (I) and ChatGPT—trained on content from contributors—collectively challenge the norms and structures that confine intellectual growth and creative expression. Joining and leading efforts to ensure inclusive and accessible design education and academic scholarship.

This manifesto serves as our blueprint, informed by work of critical scholars: bell hooks [59], Judith Butler [17], Paulo Freire [32], and Donna Haraway [48]. Reflective of personal experiences with ADHD, dyslexia, and chronic pain, this blueprint leverages Abby's neurodiversity. Their ADHD and dyslexia are great resources for generating queries that cross disciplines. ChatGPT's natural language processing capabilities provide an adaptive, responsive environment that supports divergent thinking patterns, a cornerstone of ‘queering’ traditional cognitive approaches [8, 33].

‘Queering’ involves reshaping how ideas are processed and understood, moving away from rigid, linear thought structures to embrace more fluid, associative patterns of thinking. For instance, ChatGPT dialectically responds to and fluidly shapes Abby's fragmented ideas. Reclaiming and reconfiguring traditional approaches to accommodate diverse cognitive styles are approaches to crippling [46]. In addition, ChatGPT aligns with Abby's unique thought process to structure ideas, bridge cognitive gaps, and solidify links between ideas lost in the linear mode of text-based communication. Through the use of ChatGPT, Abby's neurodiverse traits are transformed into strengths.

Use of ChatGPT also provides writing assistance by reducing screen time and typing-based work, while improving the accessibility and inclusivity of ergonomic set-ups and resulting chronic pain. With dyslexia, screen and typing-based work require substantial focus, grit and care work [12] to achieve. With ChatGPT-in-the-loop, this labor is lessened, as ChatGPT interdependently responds to prompts with suggestions for additional questions—indicative of the AI's ability to engage in a reciprocal, dynamic dialogue, adapting and evolving based on user input and needs [10]. Other ChatGPT features used by Abby include: (1) responding to questions for content, (2) receiving and remembering instructions from Abby to fine-tune the experience, and (3) drafting outlines and tables based on ideas Abby used ChatGPT to make.

The ability for ChatGPT to be customized showcases its potential for incorporating disability considerations into digital tools. It allows for responding to common accessibility heuristics (e.g., clear and consistent navigation, readable and understandable content, contrast and legibility, structured headings and labels, alternative text for non-text content, compatibility with assistive technologies, error identification and recovery, and flexibility in viewing options). ChatGPT recognizes divergences and misspellings as opportunities, transforming and reframing errors into capacities [61]. We embrace the influence of ADHD and dyslexia on Abby's sense-making and use of multiple modes of expression to redefine her relationship to writing.

Importantly, along with these benefits come great responsibility for Abby or other users of ChatGPT. It means not trusting ChatGPT in every way, anticipating hallucinations, and fact-checking and referencing. We also remain cognizant of diverse ethical concerns and implications of using AI in this way. This means meticulously auditing data inputs and algorithmic processes to mitigate biases [74], and aligning models with our commitment to diversity and inclusion. Data used to train AI-based collaborators and assistants should assimilate diverse data and critically analyze and apply it to ensure a holistic and inclusive approach in information processing [16].

Through this work, we actively participate in a broader movement towards inclusivity and diversity in academic discourse on

Manifesto Creation Process Organized by Themes			
No.	Theme	Aspect/Topic	Details and Example User Prompts
1	Conceptualization and Planning	Goal Definition and Scope Clarification	Define the primary message, target audience, and key themes. Example: "Please create a matrix indicating the shared and unique attributes of queering vs crippling."
		Structure and Organization	Plan a logical structure for the manifesto. Example: "Recreate the same manifesto, but after each paragraph extend the text..."
		Purpose and Intent	Keep clear intentions in each request. Example: "Keep the same, but can it be edited in small ways to create greater coherence?"
2	Dialogue and Refinement	Interactive Dialogue Approach	Engage in a back-and-forth dialogue to refine ideas. Example: "Revise so it is a statement from Abby."
		Feedback and Revision Cycles	Revise based on feedback to refine the manifesto. Example: "Don't change the writing or sentences. Just remove words that are not necessary."
		Customization and Personalization	Customize the manifesto to reflect personal experiences. Example: "Incorporate my personal experience with AI in the manifesto."
3	Writing and Style	Lexical Richness and Diversity	Use specialized, academic vocabulary. Example: "What does it mean to use ChatGPT in a queer way?"
		Syntax and Sentence Structure	Employ complex sentence structures. Example: "Merge all, remove redundancies, reorder any, and listen to all directions inline for a 700 word manifesto."
		Cohesion and Coherence	Ensure ideas are logically organized. Example: "Combine all the elements discussed into a comprehensive manifesto..."
		Tone and Style Consistency	Maintain a consistent tone. Example: "Ensure the manifesto maintains a formal yet accessible tone throughout."
		Variation in Requests	Use flexible language for different objectives. Example: "Craft this into a 700 manifesto, witty in style, with topic-related puns."
4	Engagement and Creativity	Engagement with Abstract Concepts	Engage with theoretical frameworks frequently. Example: "This manifesto does not include a reflexive voice from ChatGPT..."
		Utilizing AI for Creativity	Leverage ChatGPT for creative suggestions. Example: "How can writing with ChatGPT help in managing the challenges of chronic pain?"
		Call to Action	Include a call to action to engage readers. Example: "Draft a call to action for readers to explore AI in their writing."
5	Reflection and Meta-Cognition	Reflectiveness and Meta-Cognition	Analyze own writing and thought processes. Example: "This manifesto does not include a reflexive voice from ChatGPT..."
		Pragmatics and Contextual Understanding	Tailor language to suit specific tasks. Example: "For each section, let's define effective strategies users can employ to support queering and crippling of ChatGPT."
6	Ethical and Practical Considerations	Addressing Limitations and Biases	Be aware of AI's limitations and potential biases. Example: "How can we redefine productivity in writing to focus on impact, engagement, and resonance?"
		Legal and Ethical Considerations	Mind legal and ethical considerations when using external content. Example: "Are there any IP considerations I should make when using ChatGPT here?"
		Publication and Dissemination Strategy	Plan for the publication and dissemination of the manifesto. Example: "Combine all elements discussed into a comprehensive manifesto outlining the human-AI collaborative writing journey."
7	Impact and Evaluation	Evaluation and Impact Assessment	Evaluate the manifesto's impact and reception post-publication. Example: "How can we assess the impact of our manifesto in the academic community?"

Table 1: Abby utilized ChatGPT to create the Manifesto using a variety of prompts, reflected in the table above. Over time she has refined her approach. At first, learning to be a prompt engineer, for the refinement of her ideas, felt like revealing secrets. As she started to see patterns and limitations, she weighted the trade-offs with the hope and understanding that the data from each chat would not be used by OpenAI in its entirety. She started using keywords, issuing rules and syntax to follow, and asking for evaluation criteria and an analysis of the emerging human-AI collaboration. She then started entering full bodies of text. She is still not clear how to eliminate redundancy in the responses she gets, and she still spends a lot of time fixing errors, misunderstandings, and clarifying text. All the while, she still unintentionally says 'please' and 'thank you' to ChatGPT—ChatGPT does not do the same—while defining new custom instructions that are applied to every thought.

integrating ethical AI into teaching and learning (e.g., [65]). Our aim is to ensure that the representation of marginalized communities is amplified through their voices and choices so as to reduce misinterpretation or bias [11, 93]. For humans involved in this endeavour, this means taking on responsibility to continuously learn and adapt ChatGPT's methods to align with human values and to take an activist stance towards the curation of datasets [75] and the prompts we use [38], while reflecting on and adjusting our sense of ownership of the content created [106]. As an AI agent, ChatGPT (as an AI managed by people) should be trained on data collected through practices that go beyond notice and choice [75].

In closing, using ChatGPT for knowledge work and sense-making queers linear narrative structures and texts [21] and glitches heteronormative and ableist narratives [24, 98]. This also means providing ChatGPT with initial ideas or themes and then following how it expands upon that content. The interdependence and adaptability of this human-AI collaboration symbolizes alternative forms of expression [23]. Through meta-reflection of our relationship [90], we will, and hope you will too, continually assess how ChatGPT can be used to enhance 'queering' and 'cripping' in the writing process and through this process, ourselves. This reflective practice is crucial for ensuring that our use of AI remains true to our goals of fostering inclusivity, diversity, and creativity in our work.

In solidarity and anticipation, Abby (with ChatGPT 4.—and when credit ran out, ChatGPT 3.5, December, 2023)

4 REORIENTING TECHNOLOGIES OF PRODUCTIVITY

In this paper, we explored different ways to resist productivity narratives by glitching technologies that started from each of our queer, crip experiences. We purposefully used these technologies (Mendeley, Figma, and ChatGPT) to glitch, or break out of their intended uses or affordances. For Sylvia, glitching Mendeley took the form of annotating feelings within the software and using its Notes feature to poetically reflect on her experience with chronic illness. For Allie, glitching Figma meant both thinking through glitch aesthetics and subverting Figma's product design focus to craft a queer interactive narrative. For Abby, glitching ChatGPT meant prompting it in alternative, personal, and reflective ways and shifting from its universalist outputs to foregrounding marginalized voices. Together, we offer different ways to relate to these technologies beyond their expected uses to invite alternative design approaches.

However, we recognize the tensions and contradictions in our attempts to subvert productivity this way. For example, in glitching the design process, we navigate the inherent tensions between these tactics and their over-categorization and appropriation that diminish their radical potential [33], as in using glitch or rainbow aesthetics for a corporate marketing campaign. Further, in presenting this paper and using these technologies, we are also nevertheless caught in a productivity cycle (of research itself) even when we purport to use the technologies "unproductively." We therefore echo Howell et al. in resisting the binary of "unproductive" and "productive" [61], building on this work to explore queer / crip tensions of "glitching" within normative systems. For this reason, we imagine that resisting productivity does not necessarily mean that our work is entirely "unproductive" or that we must literally break the

software we use. Acknowledging that we are also "caught" as academics in the cycle of publishing, especially as junior scholars, we see this work as a provocation for conversations about the tensions of working within a system that we are trying to resist, inviting strategies on doing slow scholarship while surviving in demanding academic spaces. **Therefore, we use our work as an invitation to call for reorienting our relationships to these technologies and the cultures in which they are embedded, moving beyond productivity, beyond breaking, glitching, and failure towards compelling directions that eschew progress-oriented measures and center queer and crip ways of knowing.**

We created our manifestos individually to reflect our situated experiences and positionalities, but we shared them together as an un-manifesto, in dialogical reflection, to emphasize our commitment to coalition-building. With our individual reflections, we acknowledge the risks of reifying categories (queer and crip). However, through collective efforts, we resist, as Kafer suggests, fixing our categories in place, instead getting them "moving on the questions that face those of us committed to and invested in such positions" [69, p18]. Specifically, though we share our manifestos separately, we came together, co-created, and iterated on our works collectively. As such, we highlight our collective un-manifesto as both individually situated and coalitional. While reflecting on our relational engagements, we also acknowledge what is missing in our critiques of productivity and calls for collectivity, including unpaid maintenance and care work that is often overlooked in the conceptualization of "productivity." We join queer and crip scholars in highlighting this work, along with commitments to care, interdependence, and coalition-building [5, 23, 50, 97]. **In creating not only our un-manifesto but also queer / crip coalitions, we join calls for queering / crippling productivity in design by building collectives that share vulnerabilities, break down power dynamics, and embrace tensions in diverse perspectives.**

Finally, in engaging with queer and crip temporalities, we highlight the alternative tempos embedded within the bodies of our manifestos that resist normative publication cycles. Sylvia's manifesto exemplifies a form of slowness in its construction, patiently cultivated over 10 years of living with illness and incremental reflections from reading over time. Allie's manifesto exemplifies a resistance to fixity, linearity, and chrononormativity, as it purposefully allows for multi-sequential readings with a plurality of narrative possibilities. Abby's manifesto embraces multiple, simultaneous, non-linear formations of ideas through dialogical affordances, reflecting a culmination of her lifelong journey with learning disabilities. **In designing with queer / crip temporalities, we join calls for elevating non-normative temporalities [37, 40, 57, 76, 88, 89, 92] to embrace slow, multi-sequential, and non-linear paces.**

We end by calling for practices of slow activism through small yet consistent acts of defiance against normative structures and expectations of productivity that "eschew immediate visible and measurable outputs" [77, p341] and thus allow for actional resistance outside of epistemological traditions that reinforce harm. We started from sharing our own experiences and vulnerabilities, and imagining new ways of relating to technologies of productivity. We invite others to start with small acts of crippling and queering, which might also include resting, pausing, and slowing down.
