Abstract

Given the growing global crises caused by the growth economy, there is a pedagogical responsibility to prepare future Human-Computer Interaction (HCI) professionals to embrace uncertainty and question unsustainable ideologies and practices. This workshop creates a space for educators and students to critically reflect on how HCI pedagogy might move beyond “bigger-and-faster” framings and toward practices of sufficiency, repair, and care. Through activities such as co-designing a living syllabus and reimagining evaluation criteria for student work, participants will explore how education can itself function as an infrastructural practice for cultivating post-growth perspectives within HCI. In doing so, this workshop aims to foreground pedagogy as a vital site where post-growth commitments can take root, reorienting the content and practice of HCI toward cultivating socio-ecologically just futures.

CCS Concepts

• **Human-centered computing** → HCI theory, concepts and models.

Keywords

Post-growth; Degrowth; HCI; Sustainability

1 Overview

“As HCI educators, we are part of the process of HCI’s future-making. This future-making could ‘be carried out towards the design of technologies that will be appropriate for a future with a scarcity of resources’ [28].... The next generations of HCI professionals may require skills and knowledge to address sustainability problems as a part of their work and life.”

–Sharma et al. [23]

The economy’s relentless emphasis on growth has placed unsustainable demands on the Earth’s finite resources [9, 10, 25]. Against this backdrop, the *post-growth philosophy* has emerged as both a critique and a vision for an alternative economy in which (a) production and consumption is guided by ecological sustainability; (b)

social justice and self-determination are foundations of the good life; and (c) infrastructures are redesigned to reduce dependence on capitalist expansion [9, 10, 12, 21]. Within Human–Computer Interaction (HCI), scholars are increasingly interrogating the field’s alignment with economic growth, turning to post-growth [1, 16, 23]. Contributing to these efforts, our CHI 2024 [26] and CHI 2025 [24] workshops brought HCI scholars together to critically examine ways in which growth logics manifest in HCI and discussed strategies for resisting them. The workshops marked crucial foundational steps toward cultivating post-growth HCI practices (see the outcomes of past workshops here [27]).

However, beyond design and research, growth logics are also reproduced in ways we teach HCI; also, promoted by the larger neoliberal setting we are part of [20]. Curricula that equate success with speed, novelty, and scale, and assessment systems that reward output counts and competition, implicitly train students to accept economic growth as the default [19, 22]. These pedagogical structures shape how emerging professionals define valuable scholarship and design, establishing habits and expectations that reverberate throughout their careers. At the same time, pedagogy can be a critical leverage point [8, 11]. It can offer an avenue where post-growth commitments can be made tangible, teachable, and durable [5]. Without interventions at this formative stage, we may risk remaining post-growth as a niche discourse, continually overshadowed by growth-oriented norms entrenched in HCI, computing, and academia, more broadly. There have been efforts made to teach topics aligning with post-growth values in HCI (e.g., [6, 7, 18]).

Building on such efforts, this workshop aims to **examine ways in which post-growth ideas can be explicitly integrated in HCI pedagogy to move beyond “bigger-and-faster” framings and toward practices of sufficiency, repair, and care**. It invites HCI educators, students, and practitioners to collectively examine: (a) *how might HCI learners be supported in questioning unsustainable growth-oriented practices?* and *how might evaluative practices be reimagined in ways that honor slowness, care, and collective responsibility?* We plan to address these questions with a pre-workshop online session and collaborative activities at our two on-site sessions at CHI 2026. The pre-workshop online session will serve as an orientation and groundwork, providing participants with an opportunity to gather and reflect in advance. Then, through collaborative in-person activities, participants will co-design a curriculum that embed post-growth values in HCI education and reimagine evaluation criteria for student work activity. With these activities, we aim to collectively explore ways in which education itself can function as an infrastructural practice for post-growth HCI.

Through this workshop, we intend to build shared, open resources that HCI educators and practitioners can adapt and extend in their own contexts to teach post-growth ideas. Additionally, this workshop will nurture a network of HCI scholars committed to experimenting with and sustaining post-growth pedagogies, along with concrete pathways for continued collaboration beyond the workshop. Overall, this workshop strengthens the *Post-growth HCI Collective*—a growing international community of scholars supporting one another in envisioning tech-mediated pathways to more sustainable and just post-growth futures.

2 Organizers

We are a diverse group of HCI professionals situated across borders, connected by our commitment to cultivating post-growth ideas in and through HCI.

Vishal Sharma is a Provost’s Postdoctoral Fellow in the Department of Computer Science and Engineering at the University of Notre Dame. His research in HCI examines the development, deployment, and governance of emerging digital systems, including AI, in order to guide their responsible design in ways that are socially just and ecologically sustainable.

Hongjin Lin is a PhD Candidate in Computer Science at Harvard University. Her research lies in the intersection of AI and social impact, critically examining the power imbalances in AI for social good partnerships and funding structures. She is developing technologies that support communities oriented towards sustainable futures, such as housing cooperatives and climate workers.

Jasmine Lu is a PhD Candidate in the Department of Computer Science at the University of Chicago. Her research focuses on the issue of electronic waste, exploring new strategies to mitigate it or better recycle it. This includes building interactive tools to assist with e-waste reuse, understanding existing networks of reuse practices, and designing interactions around caring for our devices.

Han Qiao is a PhD student at the University of Toronto Faculty of Information and a member of the Just Sustainability Design lab. Her research focuses on designing data exploration and visualization (or *visceralization*) support tools for storytelling and imagining sustainable futures.

Asra Sakeen Wani is a Postdoctoral Fellow at Carleton University, Canada. Her work leverages human-centered design methods to investigate the use of information and communication technologies in regions facing protracted sociopolitical conflicts.

Christina Bremer is a Research Associate at the University of Cambridge. She is working on the Green Algorithms Initiative, a project that focuses on quantifying and reducing the environmental impacts of computational science. More generally, by applying an HCI lens and combining efficiency with sufficiency principles, her work aims to help limit the environmental impacts of computing technology and use computing to facilitate environmentally sustainable decision-making and behaviors.

Philip Engelbutzeder is a postdoctoral researcher at the University of Siegen. His work bridges research and activism, focusing on sustainable food practices and the socio-technical infrastructures that support them. He draws on over a decade of collaboration with grassroots movements, working with those who design and develop open-source applications as well as with local communities who use them.

Christoph Becker is Professor of Information and SDG Fellow at the University of Toronto, where he leads the Just Sustainability Design lab and author of *Insolvent: How to Reorient Computing for Just Sustainability* (MIT Press 2023) [3]. He co-chaired the 2025 *Computing within Limits* workshop¹ and teaches graduate courses such as *Technologies Otherwise: Designs for Just Sustainabilities* and *Information Technology beyond Capitalism*.

Neha Kumar is an associate professor at the School of Interactive Computing at Georgia Tech. She works on responsible and

¹<https://computingwithinlimits.org/>

sustainable human-centered computing, investigating infrastructures of care to inform the design and maintenance of such infrastructures, leveraging emerging technologies. Pursuing community-engaged research, she foregrounds worker-centered perspectives and community wellbeing in contexts surrounding care. She currently serves as President of ACM SIGCHI.

Rikke Hagensby Jensen is an associate professor at Aarhus University, Denmark. Her research lies at the intersection of sustainability, everyday life, and the design of interactive, intelligent, and computational technology. She currently works within interaction design, more-than-human, and alternative, sustainable futures. This includes developing research-based open educational resources for design students on how to embrace alternative design narratives of developing digital technology in more caring, diverse, participatory, collective, and sustainable ways.

Anupriya Tuli is a Digital Futures Postdoctoral Fellow at KTH Royal Institute of Technology. Focusing on health equity, she engages with feminist perspectives to work at the intersection of HCI, global health, and taboo to understand and craft sociotechnical experiences that contribute to building just and equitable futures for all. She has experience nurturing feminist safe spaces for sensitive data collection, as well as holding spaces in the form of workshops, zine-making sessions, and round-tables on sensitive topics within the research community (e.g., [2, 13, 24, 26]).

3 Workshop Recruitment & Submission

At least three months prior to the conference, we will launch a workshop website featuring the description, call for participation, and key dates. To ensure broad visibility, we will advertise across multiple channels targeting a global HCI audience: mailing lists (e.g., CHI Announcements), Slack workspaces (e.g., Sustainable HCI), social media platforms (e.g., SIGCHI Discord, CHI Meta, LinkedIn), and reach out to our participants from the last two workshops. The organizers, who come from diverse geographical contexts, will also leverage their professional networks to reach targeted groups and broaden participation. Given the emerging post-growth sensibilities in HCI (see [1, 4, 14, 15, 17]) and based on our participation in the last two workshops at CHI, we expect at least 30–40 participants in attendance.

3.1 Submission Details

To participate in the workshop, we invite submissions that critically reflect on and contribute to the growing body of post-growth HCI. Participants may submit book chapters, articles, teaching materials, reports, syllabi, reading lists, zines, or toolkits that experiment with or might be useful to guide post-growth ideas into pedagogy in HCI. These diverse submissions can come from HCI, computing, and beyond. They will be posted on our workshop website, serving as a repository and guiding our collective discussions and activities during the workshop.

Submissions will be made through a form on our workshop website, which will remain open until February 15, 2026. The organizers will evaluate submissions based on their relevance to the workshop, the diversity of perspectives they present, and their potential to spark productive discussions. We encourage and will prioritize submissions from scholars, students, and practitioners who are

traditionally underrepresented in HCI due to aspects such as (but not limited to) race, gender, institution, and geography. Applicants will be notified of their selection via email by March 1, 2026.

Accepted submissions will be shared with all participants via the workshop website at least five weeks before the event. To nurture early engagement, we will invite participants to join the existing Post-growth HCI Slack workspace, where they can begin conversations, share resources, and connect with fellow participants as well as the existing community of scholars interested in post-growth.

4 Workshop Format

4.1 Pre-Workshop Plans

About a week before CHI'26, we will host a 60-minute virtual session on Zoom to prepare participants for the in-person workshop. This session will serve as both orientation and groundwork, creating a foundation that participants can draw on and expand during on-site sessions.

In this online session, participants will be invited to share resources that showcase alternative teaching practices for embedding post-growth principles in HCI education. These may include syllabi, assignments, reading lists, classroom activities, or reflective essays on teaching experiences. The goal is to assemble a shared open repository of pedagogical approaches that foreground values of sufficiency, care, and repair. By surfacing and sharing these resources, we aim to make teaching practices legible and celebrated as critical contributions to post-growth HCI. This activity gathers diverse resources into a *collective commons* where abundance comes from the richness of shared pedagogies.

Collaboration will be supported through a shared Google document where resources, reflections, and notes can be added. The organizing team will facilitate, manage time, and ensure documentation so that the materials feed directly into live conversations at the workshop.

4.2 On-site Workshop Plans

This in-person workshop (2 sessions with a break) is designed to create space for deep reflection, collective creativity, and meaningful engagement. To support collaboration, we will provide a shared Google document for collective note-taking and reflection. Organizers will oversee facilitation, documentation, and timekeeping, while a student volunteer (with participant consent) will assist in capturing notes, photos, and recordings to document the workshop. The key activities include:

Welcome Greetings & Co-Creating Living Syllabus (90 min): The workshop will open with a warm welcome from the organizers, followed by brief introductions from participants. To set the tone, we will frame teaching as a central site for shaping the futures of HCI and invite participants to reflect on their own pedagogical commitments.

After introductions, participants will break into small groups of 3–5 to tackle the guiding question: What would a post-growth HCI curriculum look like? Drawing on the repository of resources curated during the pre-workshop activities, groups will collaboratively design, critique, and reimagine a semester-long syllabus for an HCI course or reading group that resists “bigger-and-faster” framings and instead foregrounds values of care, sufficiency, and

Duration	Activity
90 min	Welcome Greetings & Co-Creating Living Syllabus
10 min	Break
70 min	Reframing Evaluation Criteria
20 min	Final Reflections and Closing

Table 1: Workshop schedule.

repair. To scaffold this exercise, participants will organize their syllabus around a pedagogy of post-growth, drawing inspiration from Paulo Freire’s Pedagogy of the Oppressed [8]. This includes structuring the syllabus, including what to include as content, and also how to teach that. Activities may include but not limited to:

- *Unlearning as Practice*: Groups will design content and activities to make students/learners aware of and unsettle growth-centered assumptions. This would include topics on the limits of growth and need for alternatives, etc.
- *Criticality as Method*: Groups will propose content and assignments where students/learners deconstruct existing design briefs or course materials, exposing omissions, biases, and ideological framings that reproduce learned ignorance about growth and its consequences.
- *Counter-Narratives as Outcome*: Each group will articulate new framings, e.g., stories, exercises, or projects, that foreground sufficiency, ecological care, and repair as central learning goals.

Each group will then share their drafts, which will be woven together into a collective “living syllabus.” This living document will showcase diverse strategies, modules, and practices that embody post-growth commitments while remaining adaptable across institutional contexts. By treating curriculum design itself as an infrastructural practice, this session highlights pedagogy as a powerful site where post-growth ideas can take root, preparing the next generation of HCI professionals to design responsibly within social and ecological limits.

Reframing Evaluation Criteria (70 min): This session invites participants to critically reflect on how evaluation practices in HCI education—both in classrooms and institutions—can embody post-growth values. Standard evaluation tools such as grades, exams, paper counts, and citation metrics often reinforce competition, speed, and individual achievement, leaving little space for care, collaboration, or ecological responsibility. Instead, we ask: What would assessment for the living syllabus designed in the previous session from a post-growth perspective look like?

In small groups of 3–5, participants will build on the previous activity to explore alternative evaluation logics. Possible directions include: exams as collective exercises that cultivate dialogue, peer teaching, and situated problem-solving, rather than standardized measures of efficiency; collaborative and community-oriented projects where impact is measured by shared learning, contribution to local or global communities, or ecological sensitivity; ungraded or narrative-based assessments that emphasize reflection, growth, and mutual feedback rather than numerical scores. We already see some of these alternatives in, for example, Scandinavian contexts.

Each group will prototype one alternative evaluation model, sketching out its principles, methods, and implications. In a sharing session, groups will present their models, sparking discussion on how these ideas could be adapted for use in classrooms or other contexts; it will be interesting to discuss how these diverse evaluation logics play out across different educational contexts. By reframing evaluation as infrastructural practice, this session foregrounds how assessment itself can cultivate post-growth values. It aims to surface concrete strategies for resisting growth-driven metrics and for building evaluation systems that nurture thriving pedagogical and post-growth ecosystems.

Final Reflections and Closing (20 min): We will close the workshop with a collective reflection that draws together the key insights of the day. The organizers will identify recurring themes and tensions, while participants will be invited to propose concrete next steps, such as future collaborations, joint publications, online courses, reading groups, or other collective projects. To carry this momentum forward, we will end with an informal networking session, creating space for open conversation, relationship-building, and the exchange of ideas beyond the structured agenda.

5 Post-workshop plans

After the workshop, we will transform the living syllabus into an open, evolving resource for the wider HCI community. Instead of a static artifact, the syllabus will remain a shared commons, continuously enriched through contributions, refinements, and extensions by educators and practitioners interested in integrating post-growth perspectives into their teaching. We plan to share outcomes through venues such as ACM Interactions, the Computing Within Limits workshop, and blog platforms (e.g., Medium), while actively inviting the broader community to collaborate in shaping the syllabus further. We envision this syllabus serving as a commons whose elements can be adapted for a variety of contexts, including undergraduate and graduate courses, reading groups, seminars on responsible computing, workshops on sustainability, and interdisciplinary curricula that bring HCI into dialogue with political economy. By keeping it open and iterative, the living syllabus will invite new voices, case studies, and pedagogical experiments, ensuring it remains responsive to the evolving challenges and opportunities of teaching for post-growth futures.

6 Accessibility

To create an environment where everyone can participate fully, we will reach out to participants in advance to gather information about their needs. A short survey will be shared via email and our Slack channel, allowing participants to indicate their accessibility requirements. The organizing team will use this feedback to adjust

logistics and facilitation, ensuring that the workshop is welcoming, comfortable, and accessible for all.

7 Call for participation

This two-session workshop at CHI 2026, preceded by a 60-minute virtual session prior to the conference, invites HCI educators and students worldwide to critically reflect on how HCI education might move beyond the logics of “bigger-and-faster,” and toward practices of sufficiency, repair, and care. The workshop aims to foreground pedagogy as a critical arena where post-growth commitments can take root, shaping HCI’s education for socio-ecologically just futures. Through collaborative activities such as co-designing a “living syllabus” and reimagining how we evaluate student work, participants will explore teaching as an infrastructural practice for post-growth HCI.

We welcome submissions that experiment with integrating alternative pedagogies and/or post-growth perspectives in HCI or adjacent fields. Contributions may take the form of relevant book chapters, journal articles, teaching materials, workshop reports, syllabi, zines, reading lists, or toolkits that could be useful to design a post-growth HCI syllabus. Submissions should be uploaded by February 15, 2026, via the form on our workshop website. The organizing team will review submissions for relevance and potential to spark discussion. Accepted participants will be notified by March 1, 2026. All participants must register for CHI 2026 and attend the on-site workshop (without additional fee).

This workshop is part of an ongoing effort to nurture the Post-Growth HCI Collective by grounding its commitments in actionable practices. By taking pedagogy as a leverage point, it seeks to curate tangible ways to embed post-growth values into HCI’s everyday teaching and training. For more details and the submission form, visit: <https://bit.ly/4gBS6Ys>².

Acknowledgments

This workshop is dedicated to scholars across generations and geographies whose contributions have advanced HCI’s critical scholarship. Their persistence has carved out the space for us to gather, challenge, and reshape the growth-oriented logics. We stand on their shoulders as we work on cultivating more sustainable and humane futures in/through HCI.
