1 Overview

Ocean Futurisms is a collaborative project between TBA21–Academy, Radical Ocean Futures and Inferstudio. Through three original animated short films, the project invites audiences to step into alternative, science-based futures for the ocean. Blending scientific forecasts with immersive storytelling, each of the films rehearses questions for the future of ocean policy/governance through speculative scenario making and worldbuilding. These films act as simulated visions of worlds that might yet be...for better, or for worse. In this first film of the project, M.A.N.A., we follow a future ocean noise pollution data analyst - working within an alliance of island states redefining ocean governance amidst the realities of climate crisis. Designed for use in workshops and educational screenings with ocean scientists and policymakers, the Ocean Futurisms films are an ambitious experiment in the power of narrative to inspire real-world conversations about the radical and urgent changes required to safeguard Earth's oceans for the future.
