Why visualize modifications?

Understanding chemical modifications on proteins opens up further possibilities for research on rare diseases. This work proposes visualization approaches using two-dimensional (2D) and three-dimensional (3D) visual representations to analyze and gain insights into protein modifications. In this work, we present the application of **Modie Viewer** as an attempt to address the Bio+MedVis Challenge at IEEE VIS 2022.

All mutations occur on residue R (Arginine, Arg), an amino acid with electrically charged side chains.

Eight 3D structures: Four human proteins (ALDOA, DDX3X, HNRNPA1 and TGFB1) and their mouse orthologs

White for modification is absent.
Soft blue for 1-10 modifications possible.
Light red for 11 or more modifications possible.

Modie Viewer is a visualization platform emphasizing on protein modifications.

The tool is available at:
