SDU Software Engineering, The Maersk Mc-Kinney Moller Institute, University of Southern Denmark

Problem:

Cobots promise safe human–robot collaboration, but their adoption is slowed by the steep learning curve of proprietary programming languages and difficulties understanding programs written by others.

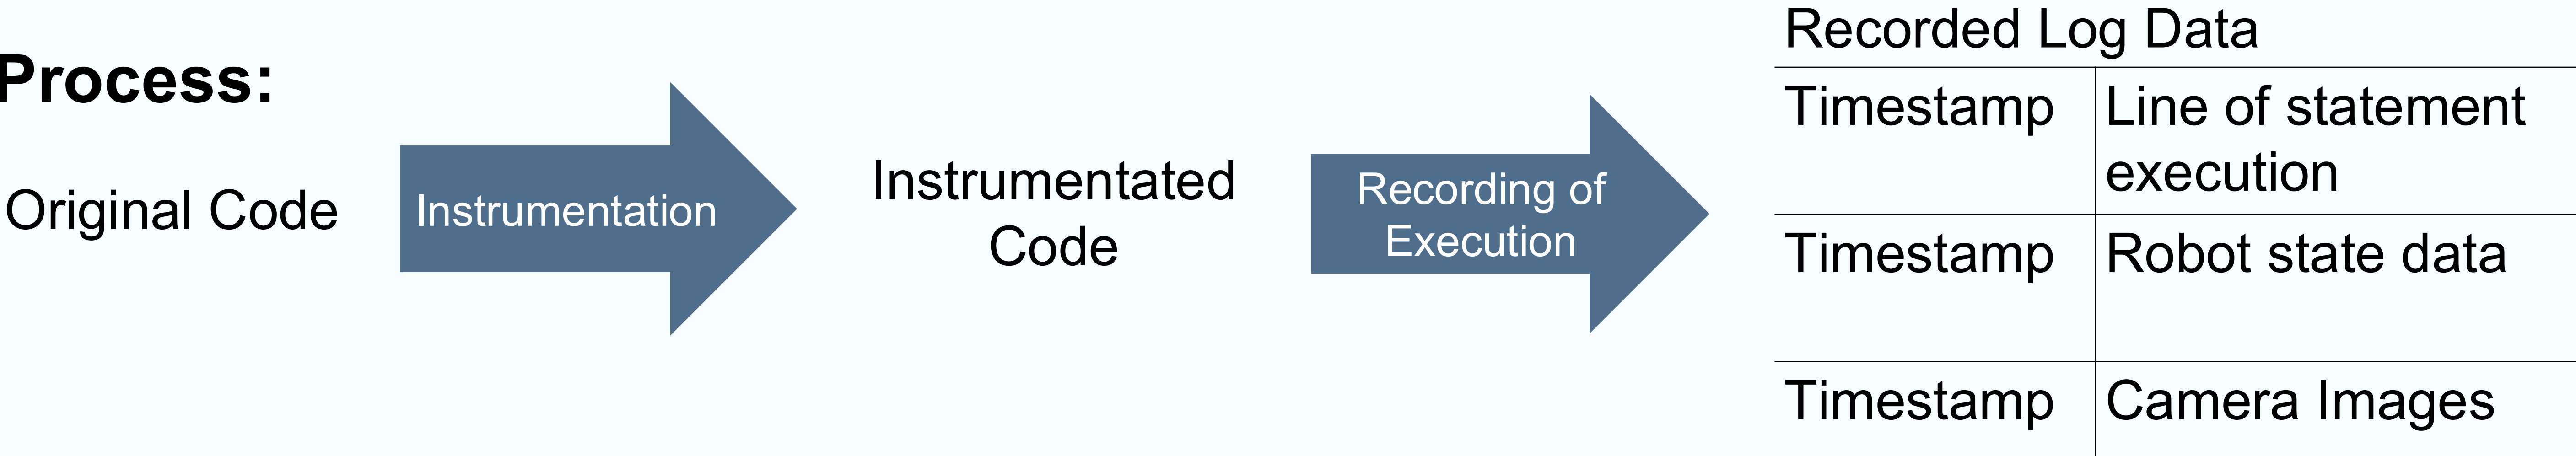

Motivation:

Encourage reuse of cobotic programs by making them easier to interpret through code execution visualizations (e.g., 3D views, camera images, time-series graphs).

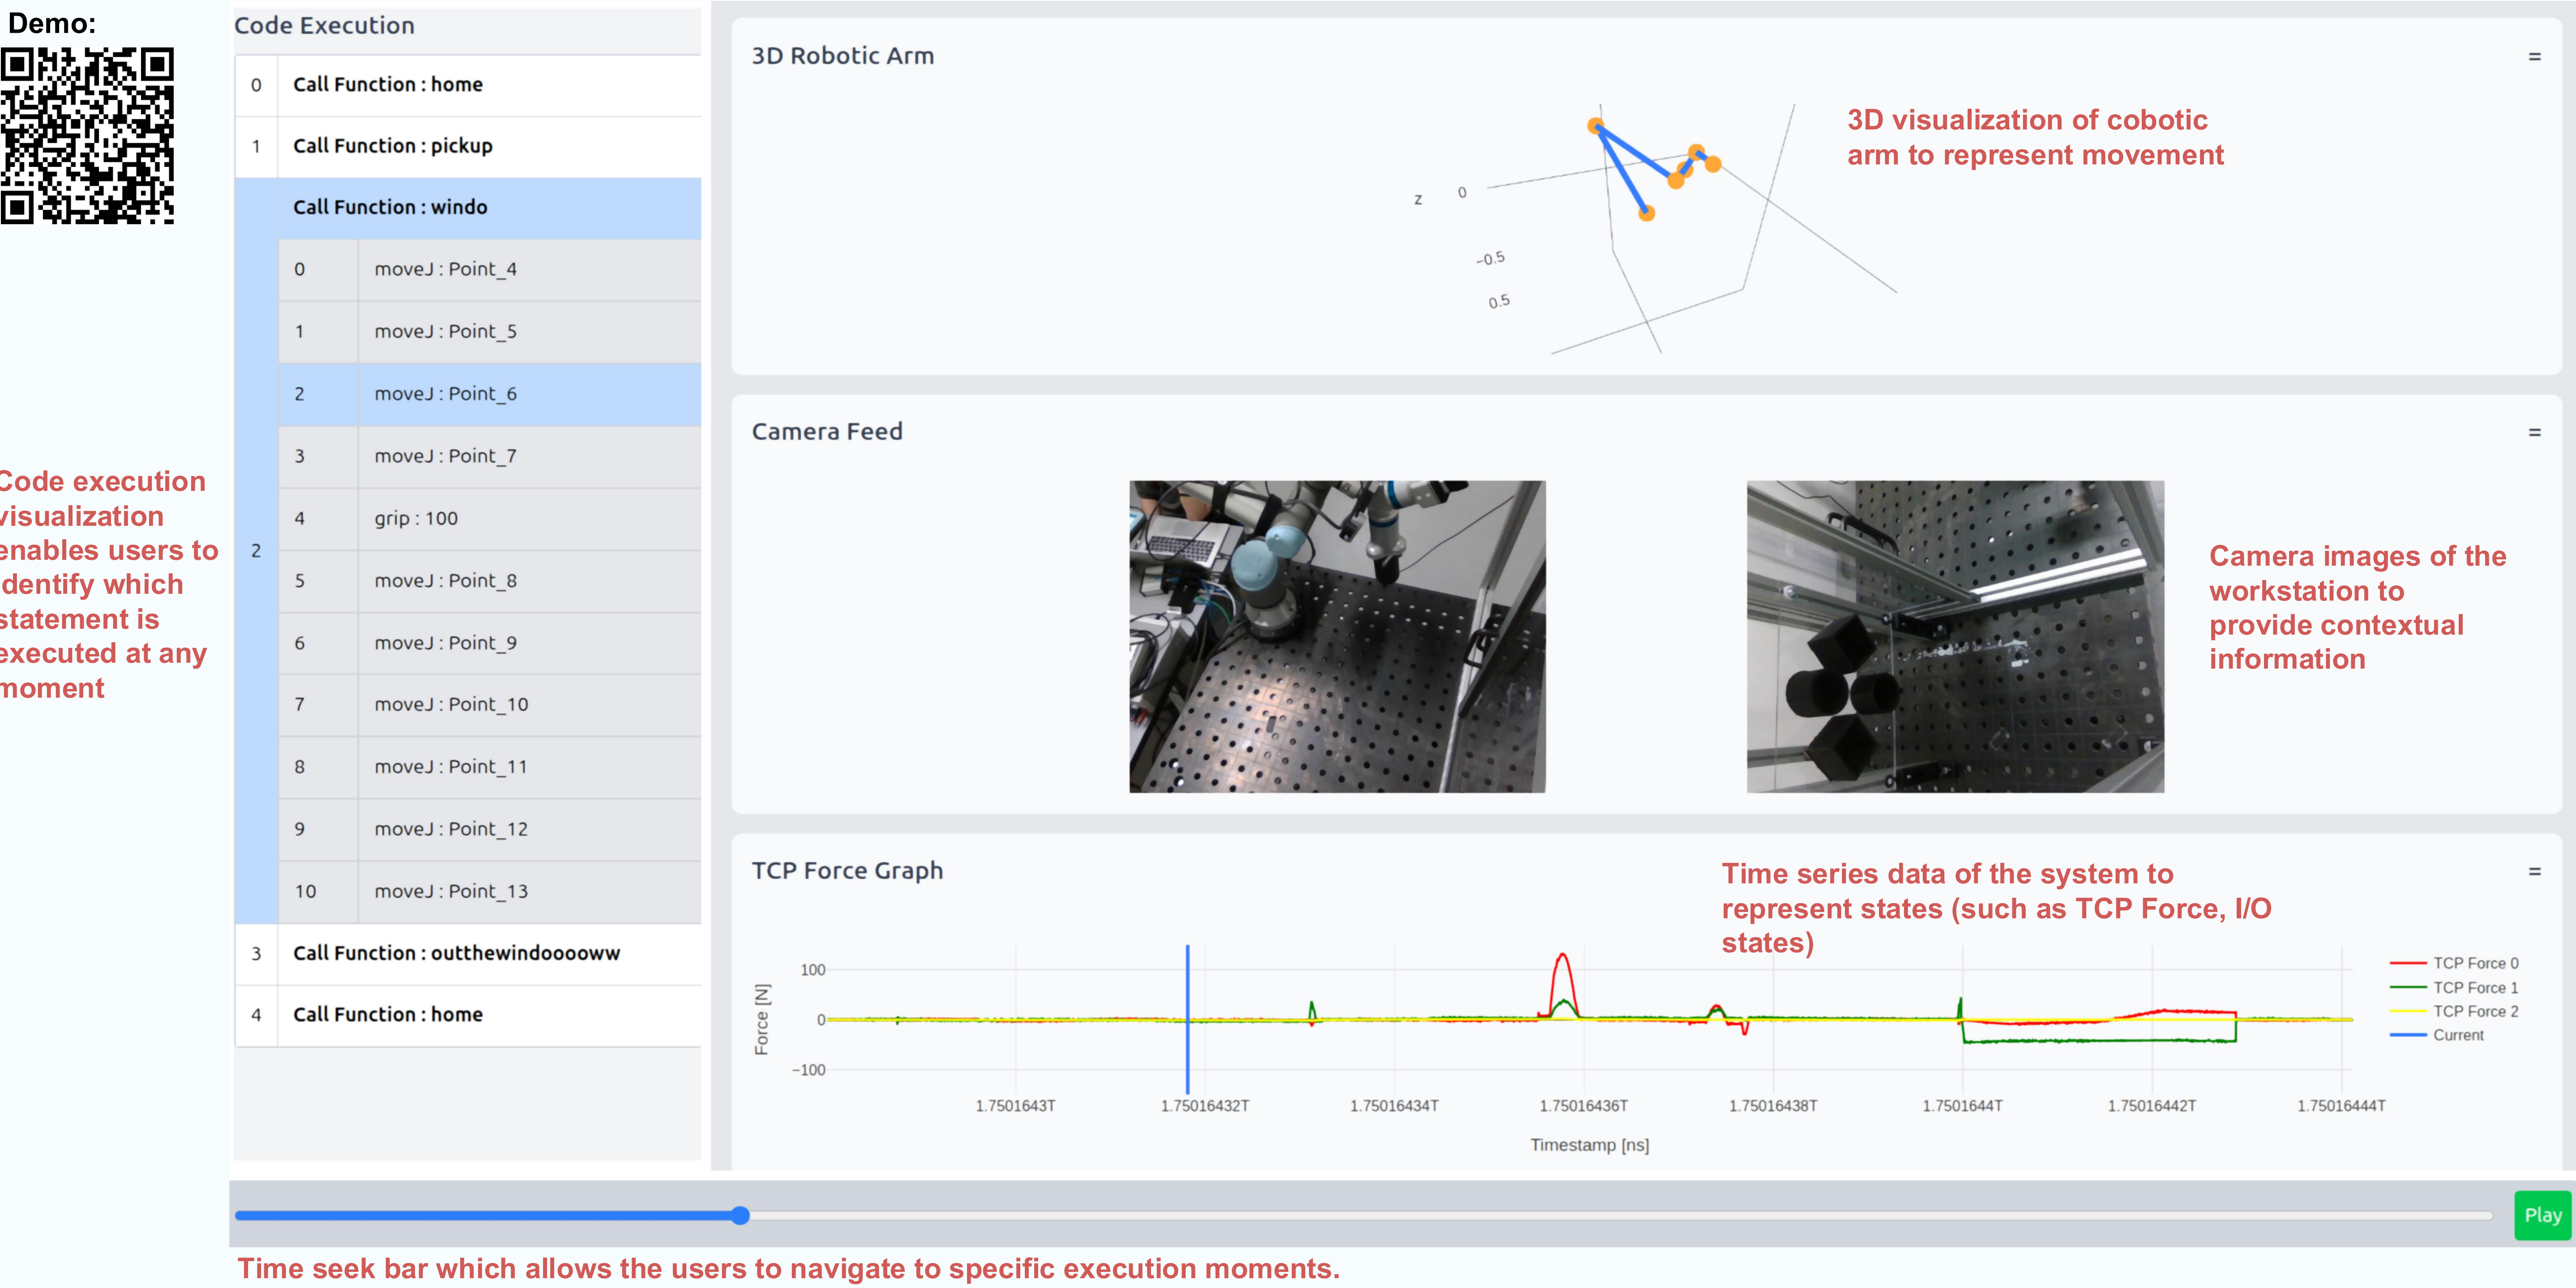

FERAViz

Visualization tool designed to ease comprehension of cobots programs for users of all technical levels. Designed to visualize system states through synchronized visualization.

Process:

Execution state visualizations:

Future work:

Realistic 3D Simulation, Add-on Status (ex. Gripper, I/O status), Tool Evaluation.
