## Abstract

This paper explores an interdisciplinary art project centered on the history of the sugar industry in Taiwan and Japan. The project integrates sound, imagery, and performance installations to create an immersive experience. Central to the study is *Tale of Tales*, the

musical component of two interconnected works, *Another Capital Beneath the Waves* and *Crystal Seeding*, which blend electronic music with historical soundscapes and traditional performances. The project employs newly designed instruments, real-time electronic music, and immersive audio, recontextualizing traditional elements such as Taiwanese glove puppetry and Japanese Bunraku music, offering a rich, multi-layered historical and cultural experience.

In *SIGGRAPH Asia 2024 Art Papers (SA Art Papers '24)*, December 03–06, 2024, Tokyo, Japan. ACM, New York, NY, USA, 7 pages. <https://doi.org/10.1145/3680530.3695449>

**1 Introduction**

The interdisciplinary music production project set against the backdrop of the sugar production histories of Taiwan and Japan explores the necessity of an interdisciplinary approach to music composition and sound design to create a cohesive and immersive experience for audiences. This study examines the role of music as a medium for connecting and re-examining historical and cultural relationships, leveraging advancements in visual and immersive technologies to highlight Taiwan's sugar industry development during Japanese rule. This paper investigates how music is created to fit into such a historically complex context. The musical work *Tale of Tales*, part of the exhibition *Another Capital Beneath the Waves*, showcases two interconnected interdisciplinary works, *Crystal Seeding* and *Another Capital Beneath the Waves*, as shown in Figure 1 and 2 [Hsu et al. 2023]. By integrating sound, imagery, and performance installations, both seek to elucidate the complex dynamics of colonizer/colonized and dominator/dominated relationships.

Although these two works are self-contained, the composer approached the entire musical work as a unified whole during creation. This project combines research and creative methodologies to produce a music performance based on the historical development of the sugar industries in Taiwan and Japan. The project traces historical and modernization memories, exploring various methods to transform and present these memories through sound using a newly designed instrument, spatial Audio, sound installations, electronic music, as well as contemporary and traditional music. These auditory elements are complemented by multi-projection films, 3D mapping, robotic arms, VR performances, and dance performances. This transnational and interdisciplinary music production aims to provide audiences with a multi-layered historical experience, exploring new possibilities for cultural exchange through the fusion of aural and visual perception.

Historically, sugar has played a significant role beyond its use as a sweetener. It was considered a potential biofuel, especially during the post-Asia-Pacific War era, as a substitute for petroleum in fighter aircraft engines. As an economic crop, sugar was instrumental in the development of modern industries while simultaneously promoting imperialism and colonialism. The economic significance of sugar, similar to other cash crops like coffee, tea, and cotton, reflects the substantial profits garnered through colonial exploitation during modernization and industrialization processes [Megumi 2023]. The monopolistic nature of single-crop economies impeded the development of other industries and economic activities, further defining the distinctions between “developing” and “developed” nations and significantly influencing the current global landscape. Colonialism driven by the sugar industry substantially altered global demographic patterns, and the history of sugar is intricately linked to the memories of both colonial and colonized nations.

Previous research has extensively analyzed the economic history of the sugar industry [Knight 2014; Stack et al. 2019] and

explored its cultural and societal impacts through interdisciplinary artistic perspectives. Significant exploration into the colonial and sugar histories of regions such as the British Empire [Bond 2023] and multimedia community projects in Queensland [Neuenfeldt 2008] has been conducted. However, the application of such interdisciplinary studies in East Asia remains limited. Studies that utilize interdisciplinary music performances to connect memories of sugar production, colonialism, and cultural differences between regions are particularly scarce. Furthermore, the creation of music and sound specifically for interdisciplinary work of this nature has not been thoroughly discussed in existing literature. Given the performance-based nature of these works, music and sound play a crucial role. They bridge traditional and contemporary performances, integrating all elements into a cohesive whole. Thus, employing music as a medium to intertwine the histories of sugar production and colonial memory between Taiwan and Japan is both rare and significant.

**Figure 2: Performance photo from *Crystal Seeding*. ©Ting-tong Chang**

## 2 Historical Memories of the Transnational Sugar Industry: The Taiwan-Japan Connection

The work centers on the memories of the Huwei Sugar Factory, conceptualized as an image installation that depicts the historical development of the sugar industry in East Asia. The installations *Crystal Seeding* and *Another Capital Beneath the Waves* are based on two distinct historical scenes. *Crystal Seeding* is set in Huwei, Yunlin County, Taiwan, illustrating the establishment of the sugar factory by Dai-Nippon Sugar (now Mitsui Sugar Holdings) and the ensuing prosperity of the town. Raw sugar produced in Huwei was transported via the “Naitai Route,” connecting Taiwan and Japan, to Moji in Fukuoka Prefecture [Hikari 2023a]. This raw sugar was refined into crystalline sugar at the Moji factory (now Kanmon Sugar Company) and distributed throughout Japan. Thus, *Another Capital Beneath the Waves* is set in Moji, Kitakyushu City, Fukuoka Prefecture, showcasing its role as a sugar factory location and its trade interactions with Taiwan [Hikari 2023b].

Huwei is not only a sugar production centre in Taiwan but also a hub for Taiwanese glove puppetry. *Crystal Seeding* uses Taiwanese traditional puppet theater, or glove puppetry<sup>1</sup>. In echo with the *Crystal Seeding*, *Another Capital Beneath the Waves* employs Japanese traditional puppet theater, Bunraku<sup>2</sup>.

While both puppet theatres have been altered to fit into the contemporary context, *Crystal Seeding* features a puppet of a director and a cameraman interfering with the traditional play-in-the-glove puppetry. In *Another Capital Beneath the Waves*, the newly created Bunraku, the physical puppet, is a white puppet equipped with motion capture sensors. In collaboration with the Yamaguchi Center for Arts and Media (YCAM), the movements of the puppet are captured and later applied to digital animations, making the virtual puppets move and tell stories under traditional puppeteers' control [202 2024], as illustrated in Figure 3. These sensors capture the puppet's movements, which are controlled by the puppet master in the traditional style. The motion data is later used to control a virtual puppet inside Unity, and eventually, the puppet's movements are synchronized with the dancer on stage through wearable motion capture sensors.

The music part of the Bunraku in this work includes five newly composed songs by the shamisen player that adhere to the traditional Bunraku style. These songs are simple and transparent, bearing an oriental minimalistic style. Additionally, it is set in a non-traditional context, featuring a female Tayu (narrator/singer in Bunraku) and a female shamisen performer, as illustrated in Figure 4. On the other hand, the original music part of the Taiwanese puppetry, played by the ensemble, consists of musical fragments commonly seen in other Taiwanese puppetry works and is much richer in heterophonic musical texture and timbre due to the number and characteristics of the instruments.

These differences between the two puppet theatre music styles prompted the composer/music director to adopt two different approaches to incorporate them into the final presentation of the music and sound. The Bunraku songs are kept as close to the original as possible, maintaining their simplicity and minimalism. In contrast, the glove puppetry music has been greatly altered by adding layers of harmony and timbres, enhancing its complexity and richness.

These two works, focusing on the development of the sugar industry, wartime memories, and modernization history, connect the towns of Huwei and Moji. By exploring the intricate interactions between puppeteers and puppets in Taiwanese traditional glove puppetry and Japanese traditional Ningyo Joruri, the project examines the relationships between colonizers and the colonized, dominators and the dominated, and how history continually reproduces these dynamics. These puppet theatres serve as a cross-temporal and cross-cultural medium to convey historical memories of Taiwan during the Japanese colonial period. The utilizes of traditional Taiwanese puppet theatre and music weave together the memories

<sup>1</sup>Taiwanese traditional puppet, also known as glove puppetry, is a comprehensive art form combining storytelling, puppetry, music, and drama. The narrator's recitation and the puppeteer's manipulation of the puppet's movements, accompanied by background music, create a lifelike dramatic tension. It has become one of the most representative indigenous art forms in Taiwan [Museum 2021].

<sup>2</sup>Japanese Bunraku puppet theater is one of Japan's representative traditional performing arts, integrating three performance elements: the narrator (Tayu), shamisen, and puppets (Ningyo) [Coaldrake 1997]

**Figure 3: Motion capture data from the Bunraku puppet applied to a digital animation puppet, enabling traditional puppeteer manipulation for posing and storytelling. ©Ting-tong Chang**

**Figure 4: Bunraku performance setup featuring a female tayu (narrator/singer) and a female shamisen performer in a cave. ©Ting-tong Chang**

of the colonial modern industry of sugar production and the Taiwanese people's involvement in the "Greater East Asia War" as part of Japanese territory. This is depicted through percussionist's performances at the sugar factory and the glove puppetry performance of the imperial theatre play *Kurama Tengu*<sup>3</sup>, portraying Huwei's

<sup>3</sup>Kurama-tengu (The Goblin of Kurama) is a fifteenth-century Noh play that explores the early life of samurai hero Minamoto no Yoshitsune [Foster 2024].

modernization memories centred around the sugar industry, as shown in Figure 5.

This project also highlights the critical role of music and sound in performance-based interdisciplinary works involving new technologies such as VR, 3D modelling, and motion capture. The creation of music for such complex historical contexts necessitates innovative approaches in composition and music technology to ensure a cohesive and immersive audience experience.

**Figure 5: Taiwanese glove puppetry being filmed and recorded in a Huwei sugarcane field. ©Tak-Cheung Hui**

### 3 Production Process and Content: Tale of Tales

The exhibition *Another Capital Beneath the Waves* showcases two interconnected interdisciplinary works: *Crystal Seeding* and *Another Capital Beneath the Waves*, with musical and sound design compositions titled *Tale of Tales*.

*Another Capital Beneath the Waves* was performed and recorded in June 2023 at YCAM in Japan. *Crystal Seeding* premiered in September 2021 at the Taiwan Cultural Lab. These works are part of a three-year project that started in the fall of 2020 and concluded in the summer of 2023. The exhibition will tour the Honggah Museum from May 4 to June 30, 2024, featuring both video installations.

Drawing from the historical contexts of the sugar industry and warfare, the project employs modern technology to examine Taiwan and Japan from the 19th century to the present. The composer utilizes various methodologies to connect contemporary soundscapes with historical ones through diverse timbral variations.

These methodologies include reconstructing musical instruments from war remnants such as bomb shells and aeroplane parts and using physical modelling sound synthesis with actual sugar to recreate liquid and solid sugar as musical materials. Soundscapes are captured from sugar factories and their surroundings in Taiwan and Japan, incorporating real-time interactive electronic music to blend historical and contemporary sounds, enhancing musical tension through environmental contrasts. Traditional music elements familiar to Taiwan and Japan, such as the suona, erhu, shamisen and narrative singing, are integrated with non-traditional settings to create associative sounds and a sense of disconnection and conflict.

The project aims to inspire audiences through interdisciplinary cultural elements, promoting an understanding of colonial history via site-specific performances and reintegrating these sounds into

modern life. This research highlights the potential of traditional materials to create novel soundscapes and enrich the contemporary auditory experience.

### 3.1 Newly Designed Instruments

**3.1.1 Sugar Instrument.** The sugar instrument utilizes sugar in both solid and liquid states to explore unique timbral qualities, drawing inspiration from traditional sugar factories in Taiwan and Japan and integrating their essence into a contemporary artistic framework. This instrument exemplifies the fusion of historical material science and modern sound engineering. Transforming traditional materials into innovative sound-producing devices provides diverse timbral possibilities essential to the project's sound design, offering new avenues for artistic expression and auditory exploration.

In the solid state, the instrument is created by melting white sugar powder through boiling. The melted sugar is then poured onto a plate and allowed to solidify, forming multiple layers with an optimal 3–4 cm thickness, as depicted in Figure 6. The resulting solid sugar plate's size directly influences the pitch, with larger plates producing lower pitches. This method generates diverse tonal variations, contributing to the instrument's rich timbral palette.

Sugar is dissolved in water for the liquid state and placed inside acrylic cylinders of varying heights. The different heights of the cylinders alter the resonant frequencies of the liquid columns, thereby producing a range of pitches. This approach allows for a broad spectrum of sound characteristics, enhancing the instrument's overall versatility.

The sugar instrument's dual-state design allows for extensive exploration of its acoustic properties. This bifurcated approach facilitates a comprehensive examination of the material's acoustic potential, bridging historical material exploration with contemporary sound design.

**Figure 6: Sugar instruments of different sizes. Photo taken during recording session at YCAM. ©Tak-Cheung Hui**

**3.1.2 Metal Instrument Installation.** Complementing the sugar instrument, a metal instrument installation inspired by various jet fighter parts is created. The choice to emulate a jet fighter stems from the historical context of the Huwei factory, which used sugar as fuel for kamikaze jet fighters [Chang 2023]. This percussion

installation is divided into five parts, each designed to mimic traditional percussion instruments such as the guiro, crotales, wind chimes, rainstick, and thunder sheet, as illustrated in Figure 7. The composer has written an original score specifically for these metal instruments, as shown in Figure 8. In this score, the percussionist is asked to use mallets, beaters, bow, and hands to play the instrument, providing various pitches, timbres and textures. This approach further enhances the project's exploration of material-based sound production, offering a unique blend of industrial and musical elements that contribute to the overall auditory landscape.

### 3.2 Electronic Music and Immersive Audio

Integrating advanced electronic music techniques and immersive audio technologies is a cornerstone of this project. By utilizing software such as CataRT [Schwarz et al. 2006] for real-time concatenative synthesis and Spat [Carpentier et al. 2015] for spatial audio processing, the project aims to create an enveloping auditory experience. These tools facilitate intricate sound manipulation and spatialization, significantly enhancing the immersive quality of the performance. The electronic elements are meticulously designed to interact seamlessly with the acoustic sounds of the newly created instruments, effectively blurring the lines between the physical and digital realms.

The extensive use of concatenative synthesis in this work is particularly significant. This technique involves assembling fragmented sound information, akin to piecing together fragments of history, stories, and information into a cohesive whole. This method mirrors the project's thematic objective of integrating historical and cultural narratives into a contemporary sonic tapestry.

Spat, a plugin developed by IRCAM, is used to control the sound objects in real-time, allowing for the presentation of multiple complex sound layers simultaneously. The inclusion of randomness in the movement of these sound objects ensures that every performance is uniquely different, embodying the composer's appreciation for the concept of "sweet accidents" in the performing arts.

In *Another Capital Beneath the Waves*, the immersive audio setup employs a sophisticated 12.2 surround sound system, augmented by two hidden speakers and two bass shakers installed beneath the audience's seating. The seating is a raft installation constructed from Tatami, traditional Japanese mats used as flooring material. This setup enhances the auditory experience and allows the audience to feel the vibrations of the sound and music, creating a deeply immersive and tactile engagement with the performance. The use of Tatami mats also echoes the visual elements with the stage and the visual images in the film, reinforcing the project's cultural and aesthetic coherence.

In *Crystal Seeding*, an 8.2 surround system plus three outdoor loudspeakers are employed. The outdoor loudspeakers occasionally play historical air sirens and other war-related warning alarms, aligning with the Taiwanese glove puppetry's visual content and text. Lighting is used to reinforce this effect by illuminating the outdoor loudspeakers when they sound, enhancing the immersive and thematic resonance of the performance. Figure 9 illustrates the speaker layout for both works.

The electronic music and sound also act as a bridge for the see-through VR experience, allowing viewers to witness a dancer moving through a sea filled with historically contextualized objects. This VR experience includes 3D models of spaces such as the sea cave, where performances take place on a small, uninhabited island near Moji Port. This combination of immersive audio and VR technology creates a deeply engaging and historically rich environment, blending past and present through innovative multimedia elements.

For the installation part of the work, the robotic arm used in the original version of *Crystal Seeding* and the attempt to do 3D printing with sugar is significant. The more electronic and digitalized instrumental sounds and even the recording of the noise produced

by these machines are crucial to creating a more immersive environment.

By merging these advanced audio technologies with traditional materials and cultural narratives, the project offers a unique and immersive sensory experience that transcends conventional auditory boundaries, allowing the audience to engage with the performance on multiple levels.

**Figure 9: Speaker layout for both works (upper part: *Another Capital Beneath the Waves*, lower part: *Crystal Seeding*).** ©Tak-Cheung Hui

### 3.3 Recontextualizing Traditional Musical Elements

This project recontextualizes traditional musical elements by integrating and transforming aspects of Taiwanese glove puppetry, Japanese shamisen, and Bunraku vocal music into a contemporary context. By blending these traditional sounds with modern electronic techniques, the project honors cultural heritage while introducing innovative interpretations. The erhu, Chinese percussion elements from glove puppetry, and narrative singing styles add cultural depth to the sonic tapestry.

Although the five songs are not greatly varied, the transitions before and after these songs challenge the composer to ensure a smooth, cohesive musical flow without awkward changes. Thus, the five songs indirectly determine the entire formal structure, with the electronics and sound design serving as a “frame” to elevate the importance of the Bankaku-style songs.

The composer also collaborated closely with the shamisen performer, incorporating improvisational sections between the shamisen performers and the composer, who uses a computer and analog effect machines. As shown in Figure 10, these improvisations create musical fragments and passages that become integral to the work.

**Figure 10: Composer working with a shamisen performer during the recording session at YCAM.** ©Tak-Cheung Hui

Newly composed shamisen works influenced by contemporary music explore various extended techniques, bridging the digital and historical worlds. This integration enhances thematic coherence and deepens the exploration of the instrument’s expressive capabilities. Interactive sound elements evoke visual or symbolic associations, enriching the auditory experience and bridging the gap between sound and image, creating a cohesive and immersive artistic expression.

Blending the music and the sound design that contains contrasting real-life and electronic subtle noises creates sonic textures and contrasts that further shape the project’s auditory landscape. Emotional resonance is achieved through careful musical phrasing and dynamic swells. Synthesizer-like timbres and musique concrète-inspired drones made of processed recordings of Huwei and Moji provide harmonic support and directional progression, enhancing emotional impact. The interplay between layered textures, contrasts, and harmony generates a dynamic listening experience. Juxtaposing complex environments with musical differences creates tension and depth in the composition. The project aims to create a deep and meaningful connection with the audience by blending traditional musical forms with contemporary techniques.

A significant aspect is the dialogue between sound and visual elements, particularly in live dance performances with virtual reality and multi-projection setups. Immersive sound design synchronized with visual elements enhances the overall impact, exploring synesthesia where sounds evoke visual imagery. This includes the use of a siren from an outdoor loudspeaker, a military snare drum pattern played on a sugar drum and a newly designed instrument,

and metallic noises that recreate industrial sounds recorded inside a sugar factory. A party-like beat in the low end accompanies fragments of Stravinsky's *Soldier's Tale*, creating a multi-sensory experience that transcends traditional performance boundaries.

## 4 Conclusion

The interdisciplinary music production project *Tale of Tales* provides a profound exploration of the historical and cultural dynamics between Taiwan and Japan through the lens of their sugar industry histories. The project achieves a blend of heritage and innovation by integrating traditional musical elements from Taiwanese glove puppetry, Japanese shamisen, and Bunraku's music with contemporary electronic and sound technology. This synthesis honours cultural roots while presenting these traditions in new, engaging contexts.

The project also underscores the importance of seamless transitions and cohesive musical flow, using electronics and sound design to frame the traditional Bankaku-style songs, thereby highlighting their significance within the overall composition. The collaboration between the composer of Taiwanese glove puppetry, the composer of Japanese Bankaku-style songs, and the music director, who composes all other sounds and music, is central to the project. This includes creating soundscape ambiance and diegetic sounds within the moving images, ensuring all sound fragments form a cohesive whole.

The usage of technology, such as motion capture, VR, and immersive audio systems like CataRT and Spat, plays a pivotal role in enhancing the sensory experience. By incorporating elements like sirens, military snare drums, and industrial noises recorded in a sugar factory, the project creates a rich, multi-layered auditory landscape that connects historical memories with contemporary soundscapes. The juxtaposition of traditional forms with modern beats and fragments of Stravinsky's *Soldier's Tale* further adds to the dynamic tension and depth of the composition.

This project re-examines and reinterprets historical soundscapes and opens new possibilities for cultural exchange and artistic expression. It bridges the past and present, offering audiences an immersive, multi-sensory experience transcending traditional performance boundaries. However, such interdisciplinary work comes with challenges, including the complexities of integrating diverse artistic forms and the technical difficulties of utilizing advanced technologies effectively. Future research and development can focus on refining these integrations and exploring new methodologies further to enhance the fusion of historical and contemporary elements. Through its innovative approach, *Tale of Tales* exemplifies how music and technology can intertwine to create meaningful connections between historical narratives and contemporary art forms, enriching our understanding of cultural and historical relationships.
