Figure 1: Key Visual for Glisp

ABSTRACT

Glisp is an open-source project to develop a design tool that aims to combine the flexibility of computational art with traditional human-centered graphic design. It started from the author's awareness of the problems with existing proprietary software as a visual artist who works on design and video production every day. The core idea is quite simple; by using the source code itself written in Lisp as a graphic data file, it brings the same extensibility to design as a programming language. With the Lisp's power of "bootstrapping", artists including non-programmers can program unique ways to draw graphics to fit their purpose, and become to be able to speculate unexplored styles far beyond existing cliché.

CCS CONCEPTS

• **Human-centered computing** → *User centered design.*

KEYWORDS

creative coding, computational design, graphic design, generative art, lisp
