ABSTRACT

People face lots of challenges when working from home (WFH). In this paper, we used both LDA (Latent Dirichlet Allocation) topic modeling and qualitative analysis to analyse WFH related posts on Weibo (N=1093) and Twitter (N=907) during COVID-19. We highlighted unique differences of WFH challenges between two platforms, including long work time, family and food commitment and health concerns on Weibo; casual wearing habits on Twitter. We then provided possible guidelines from a cross-cultural perspective on how to improve the WFH experience based on these differences.

1 INTRODUCTION

Working from home (WFH) is one of the different forms of teleworking [23, 24], which describes a process where people use information and communication technologies [21] to work at home rather than at a centralized office location, or at any other dispersed

spaces, e.g., Starbucks or co-working offices. WFH as a mode of working became more common during COVID-19 pandemic, as many countries went into lockdown and people had to stay and work at home for long periods of time, which brings lots of challenges [5, 9, 13, 26] such as interruptions, unstable network, and lack of socialization.

Social media data has been heavily used for comparative studies. In particular, Weibo and Twitter data has been used to understand differences of public concerns during COVID-19 [12], differences of online firestorms [17] and differences of users behavior on microblogging services [14]. Apart from comparative studies, independent social media platform was used to gain insights into US-wide dietary choices [1] and characterizing users' activities [10].

In this work, we leverage data from both Weibo and Twitter to understand the differences of people's challenges of WFH during COVID-19 pandemic. The goal of our paper is to identify the unique differences of WFH challenges at the beginning of the pandemic between Weibo and Twitter users so as to provide potential suggestions for working from home from a cross-cultural perspective. Therefore, we collected Twitter and Weibo posts containing relevant WFH keywords like "working from home" and "remote work". We then did analysis using LDA and qualitative analysis as seen in previous research [2, 25] to find differences between users of the two platforms.

Our results suggest that, on the one hand, Weibo users have unique challenges on working overtime and being disturbed by messages from work at any time, spending much time on cooking and eating with their family and expressing more concerns about their health and body weight. On the other hand, Twitter users expressed more concerns about casual wearing habits. Other challenges like productivity and efficiency, equipment and device and (lack of) space for WFH are shared by both groups and have been identified by previous research [5, 9, 13, 26]. These main differences we identified could be used to adjust the future WFH strategies to be culturally appropriate, and provide possible different focus groups of WFH users from different cultures for further research.

2 BACKGROUND AND RELATED WORK

2.1 Outbreak of COVID-19 and Lockdown

According to BBC News¹, over 100 countries and districts, including many European and Asian countries, had implemented a full or partial lockdown to prevent the spread of COVID-19 by the end of March 2020. Similarly, China also implemented an immediate and strict enforced lockdown in late January/early February 2020 which coincided with the largest public holiday period - Chinese New Year or the Spring Festival. The extended public holiday made the start of the lockdown somewhat easier, as organizations and workers typically extend this official holiday period by 1-2 weeks. As a result, by the end of the holiday, around 200 million people were working remotely with their families. Similarly, American people experienced the outbreak of COVID-19 since January 2020. Many companies including Twitter² and Google³ started to allow employees to work from home since March 2020. According to an estimation⁴, there could be 16 million US workers who started working remotely due to Covid-19 as of March 27; that number is likely much higher now.

2.2 Challenges of Working from Home

The outbreak of COVID-19 sent many people working from their office to their home within a short time, for potentially extended periods of time. This unique opportunity has been leveraged by many researchers who worked on WFH challenges in various fields such as management, psychology, economics, etc. [3, 4, 8, 9, 11, 26].

One major group of literature commonly describes hardware- and space-related challenges. Recent research on health effects of telework done by Buomprisco et al. [9], through a meta-study, found that the unavailability of ergonomic work equipment and working area is one of the main hazards for the health of teleworker. Similarly, as part of the hardware problem, the connectivity issue of the internet, including the internet speed, VPN settings and remote tools, are highlighted as challenges in a survey done by Ford et al. [13], which collected responses from 1369 participants in Washington State in the US. Apart from hardware problem, the work space is also an important problem for their respondents, who improvised their work settings using dining tables. The similar connectivity challenge is also reflected by the survey regarding academicians done by Arora et al. [3].

Another major group of challenges are related to social contacts and loneliness. For example, Arora et al. [3] collected questionnaires from 210 higher education academicians to understand the use of online teaching mode during COVID-19 lockdown from the faculty perspectives. They found that the main issue is that it is hard to control students' behavior like participation. The lack of eye contact between faculty members and students are blocked so that the faculty feel hard to get feedback from students. Similarly, the results from the survey done by Baert et al. [4] and Bolisani et al. [8] showed that ties and contacts between employees and

their colleagues could be weakened when WFH. Similar challenges such as lack of social support and loneliness are also echoed in the semi-structured interviews with 39 participants done by Wang et al. [26].

Other challenges like work life balance and ineffective communications also impact both work and personal life quality. However, while the challenges for WFH have been identified in tons of work during COVID-19, the unique differences of challenges between different countries have yet to be explored, which are claimed as one of the most important issues in remote working [22].

2.3 Comparison between Weibo and Twitter users

Social media was widely used for public citizens to share their opinions and experiences. In the HCI area, Li et al. [18] have used platforms like Twitter and Weibo to explore the similarities and differences of politeness from cross-cultural perspective. They found that future-focusing conversation with group affiliation and gratitude is more polite on Weibo than Twitter. Researchers in other areas [17] studied unique differences between Weibo and Twitter in terms of how users carry out online firestorms. They found that US users use more mockery regarding political or social opinion expression against targets than their Chinese counterparts.

In the WFH challenges topic, we only found independent research during COVID-19 in the US and China separately. For example, Ford et al. [13] conducted two surveys on developers in Microsoft company of the US and found challenges like missing social interactions, poor work life boundary and poor ergonomics, etc. Similarly, Bao et al. [5] analysed a dataset of developers' daily activities from Baidu company in China. They found that children and pets could interrupt developers' work and thus developers without self-discipline would have a hard time focusing on work. Both research reflected the challenges people could have when working from home in their respective countries.

Contrary to the works discussed in this subsection, which usually focus on one specific company in one country, we aimed to get a broader overview of a variety of contexts by gathering data generated by two social media users. As such, our results could depict a bigger, more general picture.

3 METHOD

3.1 Data Collection

We used a Weibo scraping tool⁵ and Twitter official API⁶ to obtain the datasets used in this paper. Each retrieved post included its creation time, post ID and content. In total, 101,337 Weibo posts written in Chinese were crawled dated between 24th of January 2020 and 30th of April 2020; while we retrieved 52,071 posts (2nd of March 2020 to the 1st of June 2020) on Twitter. The period was selected from the early outbreak of COVID-19 to the time most employees went back to the office in China and most Twitter users also had been working from home for around three months in the US. The searching keywords included "working from home", "work at home", "remote work", "telecommuting"⁷. We removed posts

⁵<https://github.com/nghuyong/WeiboSpider>

⁶<https://developer.twitter.com/en>

⁷Keywords were translated to Chinese when searching.

that are duplicated, from robots, containing “repost”, “headlights”, “weibo video”, and not geolocalized in mainland of China (Weibo) or the US (Twitter).

To protect users’ privacy, we omitted privacy information in the data like post ID or pictures in the latter analysis. All posts involved in our analysis are only text contents that were posting on public channels.

Next, to pick our needed data, we manually analysed a total of 500 posts (250 from Twitter, 250 from Weibo) and classified each post as “relevant” or “irrelevant”. Two coders met together to discuss the classification strategies after independently classification. After reaching an inter-coder reliability score (Cohen’s kappa) of 0.6182 between the two coders, we randomly sampled and classified 4000 posts (2000 from Weibo and 2000 from Twitter) and got 1093 “relevant” posts from Weibo and 907 “relevant” posts from Twitter.

3.2 Data Analysis

We then analysed our data using LDA [6] and qualitative analysis methods, which were used in previous HCI research to explore privacy-related questions on StackOverflow [25] and investigate parents related topics on Reddit [2]. Inspired by them, we also combined these two methods, which have their respective advantages: LDA is efficient and unbiased by human’s unconscious bias, but the topic results are very general, while qualitative analysis could provide deeper insights but takes more human efforts. We expected the results of two methods accessed here⁸ should be similar.

As a first step of our data analysis, we used LDA topic modeling to model the most popular topics in the posts identified as relevant (N = 1093 in Weibo and N = 907 in Twitter) to get a broad overview of the topics. Before the topic modeling process, we used the following Python packages: *jieba* (Chinese), *NLTK* (English), *Gensim* (English) to delete stop words and split sentences into phrases and words. We set the number of topics as 10 because topics after tenth becomes meaningless based on our empirical observation. Other parameters were set as default. After modeling, we used Jaccard similarity [2] to compute the most relevant posts for each topic. Lastly, two authors discussed and identified topics of each word group by looking through words and posts in it.

In order to gain a deeper understanding of differences between Weibo and Twitter users, we then randomly sampled two subsets of 238 related Twitter posts and 260 Weibo posts in the dataset and performed qualitative analysis on these posts using Altas.ti. Based on the topic sets from LDA results, two authors manually labelled the topics (also called codes in Altas.ti) for each post. After reaching an inter-coder reliability score of 0.8238 (Cohen’s kappa) for the first 50 posts, one author did coding for the rest posts.

4 FINDINGS

In this work, we focus on differences of WFH challenges between Weibo (mostly posted by Chinese users living in mainland China) and Twitter users (mostly posted by American users living in the US). This focus can be explained by the fact that these differences may have a strong impact on WFH planning for multi-national companies, or big companies in general. Additionally, similarities

between users on two platforms have also been covered in previous literature, or can be inferred from meta-analysis of the literature.

Based on this focus, we detail four main differences (see Figure 1) between new challenges of WFH on two platforms. First, long work time with massive messages of Weibo users have led to invasion of their personal time. Second, although Weibo users enjoyed family life by cooking and eating when working from home, they also felt spent (too) much time on it, which could decrease work efficiency. Also, the long work time and much eating brought health concerns for Weibo users. In contrast, Twitter users tended to talking more about wearing casually instead of complaining about work itself like Weibo users. We now report these findings in detail.

4.1 Time Management: Long Working Hours and Massive Messages (Weibo)

The first and the most important difference is that Weibo users tended to feel busier, with longer work time and (too) many interruptions and messages when WFH. This longer working hours and expected availability outside of normal work time led to the concerns of 996 (working from 9am-9pm, 6 days per week) work schedule or even worse, 007 (working for 24 hours every day per week).

4.1.1 LDA (Weibo Topic #1, #2, #6). Although Weibo users were able to spend more quality time with their family, many of them felt that their workload increased. For example, a Weibo user shared, “Finally, it’s Friday afternoon. I work from home for a week and work more than that in the company. Maybe the team leader doesn’t want me to think other things excepting work (W-T1-19)⁹.” Another one complained that “A friend, working as HR in a company in Beijing, is affected by the epidemic. Staffs are split in on-site and remote offices. They often work overtime and have video meetings at any time. The workload does not decrease but increase, while the salary is only 50%. The cost of living such as rent and living expenses was not been reduced (W-T1-17).” One user also expressed his/her extremely long work time: “Working from home has become 15 hours a day online [tears] various things, various forms (W-T6-14).” Another user shared his tiredness when working from home, “telecommuting is too strenuous, too tiring, and low in efficiency (W-T6-10).”

Also, we see a connection between mass messages and workload. The messages could bring people more feelings of increasing workload and tiredness. “Today is Sunday, which was originally a normal day off after the Chinese New Year. It is already past nine o’clock now. Can some manager be conscious of it? Telecommuting does not mean that we have to be on standby 24 hours a day...I want to shout out in the WeChat moments. I am too tired, telecommuting is more tired than going to work (W-T6-3).”

4.1.2 Qualitative. Most posts (97/119, 81.5%) under this topic are contributed by Weibo users. They were very busy with working from home and faced unclear boundary problem between work and life. “seems to be at work all the time, seems to be relaxed all the time, too. But if you let me go to the office, I am afraid not (W:178)¹⁰.”

⁹W means Weibo, T means Twitter, TX means TopicX in the LDA results, the last number refers to the row of the post in the results table. For example, “W-T2-14” means “The fourteenth row of Topic2 in the Weibo LDA results table.”

¹⁰For purposes of readability, we labeled Weibo as W, Twitter as T, the number being the post number in the dataset.

⁸<https://github.com/gaojie058/LDA-QAResults>

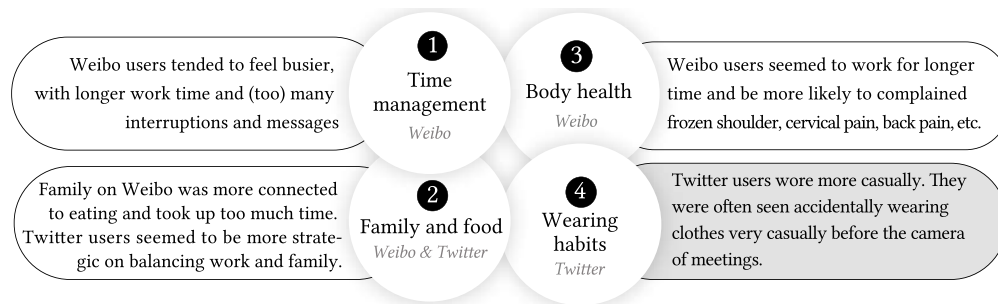

Figure 1: Main findings regarding differences of challenges of WFH between Weibo and Twitter users

They experienced the unclear daytime and night time, or unclear check in and check out time. *"Now I work from home, from day to night. I still put too much pressure on myself. I feel that my time is squeezed (W:32)."* Some people reflected that they could have meetings at night or worked until night, *"even though I was lying down to work (from home), it is tired to have meetings until night (W:125)."* Working late and working for 24 hours last for 7 days (also called 007) per week becomes natural. *"Oh my god, so tired! I don't want to work from home anymore. I hope that the epidemic is over, and everyone will happily work in the office building. 1095 becomes the legendary 996,007 (W:225)."* Even worse, this kind of unclear boundary of work and life was aggravated by lots of calls from boss, *"An average of 13 calls a day is called from the leader, as well as information replied from various groups. I make forms every day and do ideological work for the masses every day (W:141)."* *"Remote working at home means being ready to be called all the time (W:75)."* *"Telecommuting has already made me phone vibrate PTSD, now I hear the phone vibrate and my scalp feels numb and nauseous (W:256)."*

Twitter users expressed little about the invasion of work to their life. They seemed to have more right to control their life, *"I'm working from home and my boss ask me how work is going? I told him I just started my 15 min break and I'll update him when I'm back on the clock (T:71)."*

4.2 Family: Cooking Took up Much Time and Work Life Balance was Poor

Users on two platforms shared the family topic. In particular, eating and cooking was among the most important topics in Weibo users' family lives. While we did not see such an obvious connection between family and food on Twitter. Also, although Weibo users cherished the opportunity to work from home with families, they felt the work efficiency and work life balance were impacted while Twitter users seemed to be more experienced and strategic when adapting WFH.

4.2.1 LDA (Weibo Topic #0, #3). While food is a universal topic and social enjoyment throughout the world, eating is strongly linked to weibo users' social links in particular with close friends and family. Weibo users liked to cook for their families and enjoyed the time spending with them. For example, one user staying with her/his parents said, *"This long vacation taught me: cherish the time with the family, cook for my family with my heart, and eat every meal*

together (W-T3-4)." Another user enjoying the food prepared by her family said, *"The pork blood roasted tofu made by my mother at noon is delicious. Even the added garlic leaves are delicious (W-T4-6)."* However, family and cooking might take up much time so that caused poor work-life balance, *"On the fifth day of quarantine at home, my kid sit by the window every day and shout out to people outside the window...Watching the kid, cooking, and working from home, I really don't have much time to take care of the kid (W-T3-13)."*

However, we rarely see the obvious connection between family and food and eating emerging in Twitter topics. When Twitter users mentioned working from home with family, most of them seemed to be more experienced and strategic and talked more about how to balance their work and family. For example, a mother shared her successful experience of balancing parenting and life because her previous WFH experience. *"Love this! I've been balancing being a mom and working from home full time for 17 years. This is life. This is being a great dad and partner (T-T6-3)."* A man talked how he and his wife worked together rationally to balance children's school day and their work although felt hard, *"6am, my wife and I have been trying to get 2hrs of work done b4 kids need to start school day...today it is has been 1.5 hours of figuring how 2 helps the kids tackle another Monday at home... mentally getting real hard for the kids (T-T2-11)."*

4.2.2 Qualitative. Users on two platforms contributed similar percentages to family topic (29/55, 52.7% (Weibo)) and different percentages to food topic (27/41, 65.9% (Weibo)). Weibo users enjoyed cooking for family members and took cooking as an important way to celebrate or bring happiness, *"At noon, I was informed that I would go to work tomorrow?? Then I decided to celebrate and make a tomato fish (W:206)."* Also, preparing food for families is seen as the expression of love. For example, one user shared her mom prepared lots of fruits for her frequently, *"my mother always provides food for me at home. I was so 'tired' that I went to work (went through the living room). My mother stopped me and said: come and eat Mango (W:140)."* Additionally, cooking indirectly improved the work efficiency by making people feel good, *"Stimulating taste buds can improve the efficiency of working from home (W:13)."* Although cooking and eating with families looks like very positive, some people expressed concerns about spending (too) much time, which decreased their work efficiency. *"The problem has not been solved for a long time (at home). I just spent half a day to solve it in the office... Did cooking at home spend too much time? (W:159)."* As Chinese

users have more concerns about food, they may spend more time preparing for it, which could also clash with their already busy schedule while working from home.

Compared to Weibo users, Twitter users seem to be easier at eating. One user thought that working from home let lunches more delicious, *"I must admit lunches are much more delicious when I work from home. Today I'm having pulled pork and a baked potato (T:70)."* Many users reflected that they drank more beers than working at office, *"During my weekly Monday shit show 3 hour conference call that could be replaced by a 5 line email I drank 3 beers and watched American Pickers (T:145). One of the many challenges of working from home is resisting the temptation to have a beer with lunch. We Americans are such prudes w/alcohol (T:57)."*

Overall, Weibo users mostly cherished this opportunity of working from home with families and preparing food for families or enjoying the food prepared by families but expressed concerns about how to balance them while Twitter users seemed to be much easier on eating and experienced and strategic on WFH.

4.3 Wearing Habits and Health Concerns

Although we did not find difference in LDA analysis under this topic but the difference is obvious in the qualitative analysis. Twitter users expressed more about their wearing habits when working from home. They or their families were often seen accidentally wearing clothes very casually in front of the meeting cameras, which caused embarrassment among colleagues. On the other hand, Weibo users emphasized more about health and beauty concerns because of heavy work time and appearance anxiousness.

4.3.1 Wearing habits (Twitter) (15/19, 78.9%). Twitter users shared more about wearing very casually like gym pants, sport shorts, T-shirt, etc., *"I actually like working from home. I don't have to get dressed that's the best part (T:209)."* One user also shared the unwillingness to wear formally, *"Once this quarantine is over, I want to find every person who wrote a 'dress up while you're working from home' story and make them eat their keyboard (T:166)."* However, some users shared the experience of getting dressed, *"If you are working from home, who else out there is still getting dressed in regular clothes before starting each day working remotely (T:183)? Can someone explain to me why, when I'm working from home alone all day, I still feel the need to make sure my clothes match (T:167)?"* We see less part about clothes in Weibo data.

4.3.2 Health concerns (Weibo) (17/19, 89.4%). Weibo users seemed to work for longer time and be more likely to complain frozen shoulder, cervical pain, back pain, accelerated aging and long sitting time. *"I have a pain in the shoulder, a pain in the lumbar spine, and a pain in the cervical spine. The massage parlor is not open yet. I have to risk my life to go to the hospital (W:163)."* They showed concerns about body weight. *"The same life, wake up to eat, eat sleep, wake up to eat, eat and sleep again, either in bed or in bed, on the way to the kitchen, if I work from home (for a long time), the most obvious change must be getting fat fast (W:17)."* On the contrast, a Twitter user shared he/she kept exercising when working from home, *"Bruh at home work outs are no joke. My legs are dead weight now (T:9)."* They seemed to be more self-disciplined in exercise, *"I don't have enough leggings/biker shorts to work out in every day and wear sitting*

at home. This quarantine needs to end before I start online shopping (T:11)."

5 DISCUSSION

Our work extends previous research [5, 9, 13, 26] on WFH challenges by identifying unique differences between Weibo and Twitter users. This could motivate future HCI work on designing and developing culturally appropriate WFH strategies and artifacts. To this end, we now discuss potential insights and guidelines from cultural perspective and compare our findings with previous work.

5.1 Potential Explanations from Cultural Perspective

Previous research [15, 18] tried to explain the difference of data on social media from cross-cultural perspective. In our case, we identified several differences insights between two platforms, in which Weibo users are mostly Chinese and their counterparts are mostly American. These differences include Weibo users tended to have problems in time management, spent more energy on food and family and had more concerns about health while Twitter users were more causal in wearing habits. We identified relatively more challenges from Weibo than Twitter, implying that WFH could be at the early stage in China while relatively mature in the US.

To understand the deep reasons of these differences, it could be promising to explain them from culture perspective. For example, we could map "time management" to "sense of self and power distance" element in Hofstede's culture theories [16]. In a country with a high score of power distance like China, people tend to accept the inequity of power and thus tolerate the invasion of time and space from leaders. Also, the difference of family and food challenges could be mapped to "family and food" characteristic of culture: the manner in which food is selected, prepared, presented, and eaten often differs by culture [20], which shows evidence of the exist of culture difference in WFH. These insights of differences could be leveraged to improve the culture difference awareness and adjust WFH strategies to be culturally appropriate to avoid misunderstandings, which is very important in remote work [22].

5.2 Guidelines for WFH strategies

Here we provide four guidelines for facilitating culturally appropriate WFH strategies making in the future.

Respecting employees' space. Our results indicated that users on Weibo complained more about the invasion by employers or company businesses while users on Twitter complained this less. We suggest that organizations should respect employees' personal space when people from different cultures working together remotely and lack of understanding of each others' work situation. For example, sending messages at any time could be very common in Chinese culture even people complained about it while those from the US culture could experience this less. Organizations may allow more time for them to be accustomed to each other's work habits especially in WFH.

Food and family support. Our results suggest that food and eating with families were a topic of concern for the Weibo users. The role of food in family bonding is an important phenomenon in

China, and its importance in our results comes from the fact that many posters may have stayed with their parents while WFH. It is a common situation in China, especially in large cities, where young professionals prefer to stay with their parents until they get married, for monetary and cultural reasons. Multi-generational homes like these are prevalent in many parts of Asia (e.g. Thailand, Singapore, Malaysia), for similar reasons [19]. In contrast, more of their Western counterparts live in their own apartments, either alone or with their partners. This reduced the likelihood of interruptions experienced at home in Twitter data. As such, WFH planning should take these cultural differences into account, and, for example, provide more flexibility for the duration of lunch/dinner breaks to allow workers to spend time with their family during their day.

Keeping employees healthy. Weibo users complained more about health concerns due to long working hours in WFH experience. Considering previous companies' gym facilities cannot be used for people working from home, organisations should provide or collaborate with nearby gyms to provide exercise opportunities for employees.

Online meeting dress codes. Our results showed that Twitter users talked more about the wrong clothes in front of the camera. To avoid this problem, organizations could inform meeting participants whether camera should be on during the meeting, and if that is the case, provide a dress code requirement when sending the meeting invitation.

5.3 Comparison with Positive Image of WFH

Interestingly, Bloom et al. [7] conducted an experiment with the Chinese Ctrip company in 2015 reported promising results on the experience of WFH. In their experiment, 249 call center workers worked from home for up to 9 months. They identified clear advantages (improved productivity, reduced commuting time, flexibility). Our study, however, depicts a less positive image of WFH, as Weibo users were more likely to complain WFH. But the difference may be explained by the nature of participants' work: Bloom et al's [7] used call center workers whereas our study did not target specific industries (though mostly service industry). Call center workers have strict shifts and well-defined performance metrics (e.g. duration spent on call, dropped calls proportion) thus their work is under control easily.

6 LIMITATIONS

Our study has some limitations. First, we captured publicly available data from social networks, which likely may be more representative of younger, connected individuals. However, since the theme is working from home, which can be mostly done for jobs involving computers and similar technology, we argue that this limitation might not have such a strong impact in the first place, as tech savviness is expected from our target population. The second limitation is that the data was gathered during lockdowns in both the US and China, meaning that the data was definitely impacted by the ongoing pandemic. However, without the COVID-19 pandemic, it is unlikely that so many people would have ended up working from home at the same time, on the same scale.

7 CONCLUSION

In this paper, we identified the challenges and differences encountered by Twitter and Weibo users during the COVID-19 pandemic, where people had to WFH on a large scale with no to little preparation. We extracted data from Weibo and Twitter and performed LDA analysis, followed by a qualitative analysis. This combined approach allowed us to confirm challenges that have been identified in previous literature, but also highlighted unique cultural differences between Weibo and Twitter users when it comes to WFH. As for future work, extending that kind of study to other platforms would give a clearer overview of the expected challenges and culture differences of WFH over the world.
