ABSTRACT

Sustainability is a multifaceted concept with environmental, social, and economic dimensions, and its issues have manifested unevenly worldwide, disproportionately impacting those already facing marginalization. Addressing sustainability requires nuanced global perspectives; however, conversations on sustainability within CHI have traditionally been centered on the Global North. This online-only panel at CHI 2024 attempts to shift the focus to the Global *Souths* to nurture a more pluriversal perspective on sustainability by understanding the meaning, means, politics, implications, and rhetoric of sustainability from the standpoint of the Souths, amplifying voices that are often unheard and under-represented in HCI. The panel aims to draw a global CHI audience to have meaningful discussions, build a truly international community, and co-envision pathways to collectively address sustainability issues in/through HCI as they transcend geographical borders.

CCS CONCEPTS

• **Human-centered computing** → **Human computer interaction (HCI)**.

KEYWORDS

Sustainability; Sustainable Development; HCI

Extended Abstracts of the CHI Conference on Human Factors in Computing Systems (CHI EA '24), May 11–16, 2024, Honolulu, HI, USA. ACM, New York, NY, USA, 5 pages. <https://doi.org/10.1145/3613905.3643972>

1 INTRODUCTION

Sustainability is a broad, complex, and multidisciplinary concept comprising three dimensions: environmental¹, social², and economic³ [4, 8]. Although sustainability issues are undeniably manifesting globally, they are (a) experienced differently, from biodiversity loss to extreme weather events and the diminishing of glaciers, and (b) non-uniformly distributed within and across the Global *Souths*⁴ and North⁵. For example, in 2022, Pakistan suffered from massive floods that largely affected those already facing systematic marginalization and disenfranchisement, killing around 1,700 people, injuring 12,867 people, displacing 8 million people, and making 2.1 million people homeless [10]. In 2021, the United States (US) Department of Agriculture reported that Black and Hispanic households in the US suffered substantially higher rates of food insecurity than white households [6]. Taking a critical, holistic, and multidimensional view of sustainability becomes imperative, incorporating diverse interpretations and implications across geographies.

The sustainability-related conversations at the conference on Human Factors in Computing Systems (CHI) have usually centered

¹The environmental dimension suggests maintaining the carrying capacity of the natural environment to support our lives and of future generations [5, 20].

²The social dimension concentrates on nurturing values of empowerment, equity, justice, accessibility, and more [16, 26].

³The economic dimension supports the long-term economic development or financial well-being [13, 23].

⁴Global Souths indicates “multiple and overlapping ‘Souths,’ or geographic and conceptual spaces” [32] across the world with diverse cultures and philosophies [7].

⁵The terms “Global North” and “Global South” are usually used to “differentiate between affluent, privileged nations and communities and economically and politically marginalized nations and communities” [21]. While such binaries oversimplify internal differences, divisions, and hierarchies within regions and tend to exaggerate differences that obscure similarities across [9], they emphasize “the intertwined histories of modernity, colonialism, and capitalism” [9], dividing the world into the privileged and the marginalized [21]. Following Reynolds-Cuellar [24], we adopt this binary to underscore perspectives and experiences originating from the Souths while simultaneously striving to dismantle it.

on the Global North; this is not surprising as many Sustainable Human-Computer Interaction (HCI) scholars and their study context(s) are situated in the North [27]. Recently, there has been an increasing effort within HCI to engage and build solidarity with the Global Souths to address sustainability holistically, mediated by the technologies we design [15]. This focus on the Souths is crucial as sustainability transcends geographical boundaries. A lot can be learned from the traditional wisdom gathered by the cultures in the Souths (e.g., philosophies, such as *umak kawsay* or *buen vivir* from Latin America and *Ubuntu* from Africa) where despite slaughter, pillage, and colonial exploitation communities have preserved such wisdom [19, 22, 28, 30]. For example, Rifat et al. [25] noted that unlike the Global North, where the modernist principle in HCI often links sustainability to calculable cost-benefit analysis, sustainable values and practices of people in Bangladesh was based on localized ethics, a desire for non-material rewards, and a sense of belonging to a group. Recently, Sharma et al. [28] suggest HCI understand “sustainable living in cultures and societies in the Global Souths whose ontologies and epistemologies are not rooted in capitalist logic but in lived experience and care for the environment, including all life forms.” Such insights from the Souths (e.g., indigenous relational understandings) have already inspired new sensitivities in HCI [3, 7, 12, 29, 31] and may continue to inspire new ways of being, doing, and sensing in HCI. **To amplify voices from the Souths that are often underrepresented at CHI and enlighten CHI participants about sustainability perspectives from and issues in the Souths that may not be widely known, this online-only panel aims to discuss sustainability from the standpoint of HCI scholars in/from the Souths.** It builds on and extend the panel organized at CHI’23 titled, *There is no Plan(et) B: On Sustainability in/and HCI* [14].

The panel will include HCI professionals from and working in the Global Souths. Collectively, we will reflect on how the Souths and its traditional cultures approach sustainability and related topics. We will explore how sustainability can be more integral to HCI work, including the work from and in the Global Souths, often classified and sidelined by the North as “the other” [2]. The panel will be online-only to accommodate geographically dispersed participants who might not be traveling to Hawaii due to sustainability, sovereignty, and/or inclusivity concerns but plan to attend CHI virtually. The SIGCHI Sustainability Committee will be helping to engage and support in-person CHI attendees to join the panel virtually. Considering that during our sustainability panel at CHI’23, over 100 attendees engaged in the discussion, around 40 attendees responded to the post-panel survey, and 170 attendees joined the Sustainable-SIGCHI listserv post-panel, where the sustainability discussions have continued, we believe that extending the panel on sustainability with a focus on the Souths is crucial and will of significant relevance to the CHI community, drawing a larger global audience to collectively discuss sustainability concerns to co- envision pathways, taking the discussion globally [17]. This panel could be a step toward building a truly international community of practitioners, researchers, and designers working together in an integrated way to address global sustainability issues in and through HCI.

2 BIOS

We are a diverse group of HCI professionals from and working in the Global Souths on issues related to sustainability:

Vishal Sharma is a Human-Centered Computing Ph.D. student in the School of Interactive Computing at Georgia Institute of Technology, USA. His research focuses on studying and designing sociotechnical systems to enable a transition to environmentally sustainable and socially just futures beyond growth politics. Employing ethnographic, qualitative, and participatory methods, his ongoing research delves into the experiences of marginalized communities in India, such as rural farmers and slum dwellers, to comprehend the impacts of climate change on their lives and livelihoods and the design of sociotechnical systems that foreground the communities’ perspectives, experiences, and challenges in shaping policies toward climate justice. Vishal is a fellow at the Brook Byers Institute for Sustainable Systems, Georgia Tech, and an active member of the SIGCHI Sustainability Committee.

Christianah Titilope Oyewale is a master’s student at the School of Collective Intelligence, Mohammed VI Polytechnic University, Rabat, Morocco, with a research focus on human-centered design, AI, and cognitive science. She is the Nigerian Ambassador and the Delegate for Academic Affairs at the International Students Club at her university. She was recently awarded SIGCHI development funds to bridge the HCI gap in Nigeria and carry out a Hackathon to understand the diverse understandings of sustainability. With 12 years of experience in the IT industry and health care, Christianah has led projects on the sustainability of IT devices and the Internet at a military healthcare center in Nigeria. She is dedicated to mentoring small organizations in Nigeria on sustainable ways to operate their business. She is a member of the SIGCHI sustainability committee.

Eldy S. Lazaro Vasquez is a Ph.D. student at the ATLAS Institute at the University of Colorado Boulder, USA, and a member of the Unstable Design, Living Matter, and Utility Research Labs. With a diverse academic background as a Peruvian architect and an MFA in Design from UC Davis, Eldy’s interdisciplinary research focuses on sustainable design within textile crafts and wearable technology. Her research extends to the fabrication and utilization of biobased materials for applications in HCI and smart textiles. Currently, Eldy is dedicated to designing and prototyping environmentally sustainable smart textiles, considering every stage of their lifecycle from material selection to disposal. This involves exploring novel biobased materials form factors, particularly fibers, and their seamless integration into smart textiles and interactive interfaces. As a member of the SIGCHI Sustainability Committee and originating from Peru, Eldy has recently begun to explore the meaning of sustainability to members of the LATAM SIGCHI community.

Eunice R. Sari is an Adjunct Associate Professor at the School of Computer Science and Engineering, University of New South Wales. She is the CEO and Co-Founder of UX Indonesia, the first insight-driven UX Research, Training, and Consulting Company based in Indonesia since 2002, and co-founder of Customer Experience Insight Pty Ltd, Australia. With more than 20 years of experience in academics and industries, she has helped many organizations accelerate their digital transformation and pioneer innovative UX projects that affect lives and improve businesses’ bottom line in

the USA, Europe, Australia, and Asia. She teaches UX, Information Design, and Educational Technology in Indonesia and Australia. In 2014, she pioneered the first HCI and UX community movement in Indonesia and co-founded Indonesia ACM SIGCHI Chapter as the first ACM SIGCHI local chapter in Asia in 2015. In 2018, she was appointed as an Honorary University Fellow at Charles Darwin University in Australia.

Asra Sakeen Wani is a Ph.D. student in the Department of Computer Science and Engineering at IIIT-Delhi, India. Her research work lies in the area of Crisis Informatics and Critical Computing. Her work delves into the intricate and multifaceted ways in which prolonged conflicts impact human development. She has examined the nuanced and far-reaching consequences of such conflicts on education, employment, and mental health in Kashmir, India. She designs sociotechnical solutions supporting just futures and promoting social and economic sustainability in conflict-ridden regions using human-centered computing and science and technology studies approaches.

Joycelyn Longdon is an environmental justice advocate and academic. While undertaking her Ph.D. at Cambridge University, she is studying the co-design of technologies for tropical forest biodiversity conservation in Ghana. As she describes in her recent TED talk [18] the co-design involves working with rural forest-fringe communities that are commonly excluded from conservation and technology research. Her scholarly work employs ethnographic, participatory design, and machine learning methods to contribute learnings and practices to the emerging field of Conservation Data Justice. She is also the founder of [ClimateinColour](#), an award-winning online education platform and community for the climate curious, making climate conversations more accessible, diverse, and hopeful.

Laura Cabrera-Quiros is an associate professor at the Costa Rican Institute of Technology or Tecnológico de Costa Rica, working in the Electronics Engineering department. Her research focuses on the use of machine learning and non-invasive technologies (e.g. wearable and embedded devices, cameras, physiological sensors) to understand human behavior, monitor health, and improve people's quality of life. She is the chair of the ACM SIGCHI local chapter in Costa Rica and recently co-organized the 2023 summer school in Costa Rica titled *Towards Sustainable Local Tourism with CHI* [1, 11].

Pushpendra Singh is a Professor in the Department of Computer Science and Engineering at IIIT-Delhi, India. He works at the intersection of mobile computing and HCI, primarily in the areas of healthcare and education, taking a social and economic perspective on sustainability. His research takes a user-centered and participatory design approach to system building. He is a recipient of the Bill & Melinda Gates Foundation Grant for developing mobile-based learning platforms for community health workers. He has helped establish the Center for Design and New Media (an initiative of Tata Foundation and supported by TCS) at IIIT-Delhi and was the founding head of the Dept. of Human-Centered Design.

3 PANEL STRUCTURE

The panel will be virtual to prioritize and accommodate those, including most panelists, who are not traveling to Hawaii but attending CHI online due to sustainability, sovereignty, and/or inclusivity

concerns. Onsite attendees will be encouraged to attend online. The panelists and audience will be encouraged to choose virtual backgrounds that represent their culture(s) or region(s), adding a visual representation of global diversity and highlighting the international CHI community. The panel will start with a round of brief introductions from the panelists (7–10 min). **Vishal**, also an organizer, **Christianah**, and **Eldy** from the SIGCHI Sustainability Committee will be the panel moderators. They will begin the discussion by sharing the insights from the CHI'23 panel and the theme of the current panel, including the necessity to build solidarities with the Souths to address global sustainability problems. **Eunice** will then discuss how she situates sustainability in her startups in Indonesia and the initiatives she has undertaken as an academic. **Joycelyn** will describe her research with the rural forest-fringe communities, the growing field of Conversational Data Justice, and her educational platform [ClimateinColour](#). **Laura** will present how her work and efforts from the local chapter approach sustainability, what sustainability means in her sociocultural context, and how she designs technologies aimed at improving quality of life. **Asra** will explain her work situated in Kashmir, India, grappling with prolonged protracted sociopolitical conflicts, and how it focuses on different dimensions of sustainability. Finally, **Pushpendra** will share what it means to center sustainability in HCI for Development work and the challenges and opportunities to take a sustainability-oriented approach. These introductions will direct the audience toward the topic of discussion, orienting them to understand the sustainability perspectives from the Souths.

Introductions will be followed by a series of questions from the moderators (10–15 min). The questions will be curated prior to the panel via an online form advertised to the CHI attendees with the help of the SIGCHI Sustainability Committee. Some of the (potential) questions include asking what sustainability means to the panelists within their research and sociocultural contexts, what HCI can learn from the Global Souths' sustainability philosophies, how HCI researchers from the Souths might engage with sustainability in their work or why they have not hitherto, and how a global CHI community can be oriented to engage with sustainability discussion in and through their work. We will then conduct a live Q&A session with the audience (15–20 min), where the participants can ask questions directly to the panelists either through the chat feature or by unmuting themselves. The moderators will dedicatedly manage the live chat, highlighting exciting discussions and questions happening in the chat and making sure that they get addressed during the panel. The discussion until now will be audio recorded, and the moderators will take notes. However, in the end, we will allot some time (10–15 min) to conduct an unrecorded discussion, allowing participants to share comments that might be political.

We value the input of the audience on how to facilitate their involvement best online. We will support accessibility by including live captioning. We will create and share a collaborative Google document where participants can contribute critical takeaways, insights, or questions during the panel in real-time. Based on their contributions to the document, the participants will be invited to co-write an interactions article and/or blog post sharing the insights and critical discussion with the larger CHI community.

At the end of the panel, we will ask participants to join the list-serv (sustainable-sigchi@acm.org) to continue discussions, share resources, and connect after the event. The recorded panel, notes, and collaborative document will be shared for asynchronous viewing to accommodate those who could not join because of differences in time zones. Post-panel, we will share a form with the attendees to provide their feedback on what worked well, areas of improvement, and other suggestions/comments they might have that will guide future panels on sustainability at CHI.

4 GOALS AND CONCLUSION

This panel aims to explore sustainability, encompassing its meaning, politics, rhetoric, and implications, particularly from perspectives rooted in the Global South. The objective is to amplify voices often unheard and under-represented at CHI and within global HCI. By engaging the CHI audience from diverse geographical backgrounds, the panel seeks to foster meaningful discussions and co-envision new avenues for inquiry, collaborative projects, or community initiatives addressing sustainability in HCI. Ultimately, the panel endeavors to contribute to a more diverse, inclusive, and impactful dialogue on sustainability within HCI, fostering a truly international community of scholars dedicated to nurturing sustainable futures through the technologies we design.

ACKNOWLEDGMENTS

We are grateful to the vibrant cultures of the Global Souths and the wisdom of diverse traditional communities who have nurtured the art of living sustainably and in harmony with nature for generations. Their commitment to protecting our planet serves as a never-ending source of inspiration and guidance for our future sustainable endeavors. We thank the SIGCHI Sustainability Chair, Nic Bidwell, for her continued support and invaluable feedback. We also thank all those who have paved the way for us to have such crucial, much-needed sustainability discussions at CHI and HCI. Their groundwork allows us to collectively strive towards more sustainable and just futures.
