ABSTRACT

This one-day hybrid workshop builds on previous feminist CSCW workshops to explore feminist theoretical and methodological approaches that have provided us with useful tools to see things differently and make space for change. Since its inception over a decade ago, feminist HCI has progressed from the margins to mainstream HCI, with numerous references in the literature. Feminist HCI has also evolved to incorporate other critical HCI practices such as Queer HCI, participatory design, and speculative design. While feminist approaches have grown in popularity and become mainstream, it is getting more difficult to distinguish the feminist emancipatory core from other attempts of developing and improving society in various ways. In this workshop, we therefore want to revisit our feminist roots, where theory is a liberatory and creative practice, motivated by affect, curiosity, and wonder. From this

standpoint, we consider which of our feminist tools can make a significant difference today, in a highly datafied world. The goal of this workshop is to; 1) create an inventory of feminist theories and concepts that have had an impact on our work as designers, educators, researchers, and activists; 2) develop a feminist toolbox for the CSCW community to strengthen our feminist literacy.

CCS CONCEPTS

• **Human-centered computing**; • **Interaction design theory, concepts and paradigms**; **Human computer interaction (HCI)**; • **Collaborative and social computing**; **HCI design and evaluation**;

KEYWORDS

Feminist HCI, Decolonization, Care, Intersectionality, Feminist wonder

1 INTRODUCTION

The starting point for this hybrid workshop is “feminist wonder” [2]. *Feminist*, meaning “recognition of the need to eradicate the underlying cultural basis and causes of sexism and other forms of group oppression”

[11:31]. *Wonder*, meaning the multiple meanings of the word; amazement and admiration caused by something remarkable or unfamiliar; feelings of doubt; or the desire to understand. Together, feminist and wonder is to recognize many came to a feminist scholarship for different, often personal, sometimes painful, reasons. We stayed as the plurality of feminisms opened to worlds of wonder, destabilizing our senses, transforming our personal experiences into political tools and research methods.

This workshop builds on several previous feminist CSCW workshops. These workshops have had the ambition to define feminist HCI within different CSCW areas such as social media research [19], and social computing [36], or focusing certain theoretical concepts such as care [37], critical refusal [17], feminist solidarity [10], and intersectionality [7, 14]. Through these interventions and also a range of written contributions [4, 11–13, 15, 24, 26, 31, 33], feminist ideas have moved from the periphery to become a central part of HCI and CSCW. This influence has been even greater when we account for the contribution of feminist knowledge practices, including epistemologies, methodologies, methods, and conceptual frameworks. In this workshop, our aim is to reflect on the last decade’s development of feminisms in HCI, to take stock of what feminist concepts, epistemologies, methodologies, and methods have been introduced in the field, and especially discuss those that have been incorporated in mainstream HCI and CSCW/social computing research agendas to better understand their uptake for future research.

Through conversation, scholars and practitioners will engage with theoretical and methodological approaches in CSCW based on feminist theories and practices. Considerable time will be devoted to discussing how feminist theories, epistemologies, methodologies, and methods have provided us with useful tools. We focus especially on ways to achieve what Sara Ahmed calls a “feminist wonder” [2]; a feminist practice driven by affect, curiosity, wonder, and desire to destabilize and modify the structure.

We will engage in expansive perspectives of feminist work, including queer and other critical methodologies. Our hope is that by questioning our understanding of feminist approaches and theories that perhaps was taken for granted, we are able to analyze, and read it in a new light creatively, collaboratively with the aim to develop and share useful feminist tools with the CSCW community.

The workshop is hybrid to enable broad participation, and the online environment will be carefully moderated and integrated with the local environment to promote a creative and inclusive workshop experience. We view this workshop as an opportunity to advance a conversation about how to develop strong feminist epistemologies, methodologies, methods, and theoretical concepts. The goal is to 1) create an inventory of which feminist theories and concepts that have had an impact on our work as designers,

educators, researchers, and activists; 2) develop a feminist toolbox for the CSCW community to strengthen our feminist literacy.

2 BACKGROUND

In recent decades, we have seen a steady increase in feminist theories and practices in HCI. It can be said that feminisms have moved from the margin to the center of HCI and resulted in large amounts of articles with a feminist focus. Feminisms have also evolved to critique the category itself, incorporating queer, crip, decolonial, post-humanist theories and more. We especially note the presence of feminist knowledge practices that more often are embedded in methodologies and conceptual devices, though influencing the field core practice. Feminist approaches have contributed to important innovations in the design field, for example:

- Acknowledging how technologies are gendered and racialized and reproduced performatively [35].
- Recognizing technology’s potential for enabling constraints and proactively designing for liberation [22].
- Challenging researchers to consider the multi-faceted, compounding aspects of discrimination through intersectional perspectives [18, 34].
- Developing design practices that question normative values and apply crip and queer theory to recognize people’s complex identities [9].
- Adding a decolonial lens, dismantling and reimagining existing power structures, as well as balancing Western heavy influences in technology design [16, 25].
- Introducing the idea of feminist care practices, attending to who, what and how things get cared for [23].
- Developing a feminist post-humanist design, decentering the human in the design process [29].
- Combining feminist utopianism with participatory design methods to explore a radically better future as designers without attempting to define that future as a prerequisite to action [5].
- Contributing to fairness-aware machine learning algorithms [8, 27], and more feminist human-robot interaction [38].

While feminisms have influenced the field and grown in popularity, it can be at times difficult to distinguish what feminist HCI is. Much like CSCW/social computing as a whole, it seeks to develop and improve society in various ways. Feminist perspectives have not least importantly contributed to pointing out how different norms and beliefs affect what we choose to study, and how we see the purpose of design. This has motivated research that provides alternative perspectives and examines marginalized groups. Here, the design interventions compensate in various ways for the injustices of society and have the ambition to set things right so that the inequalities are reduced. In Sara Ahmed’s words, one can formulate it as “institutions that have historically been sites of exclusion ‘will become’ inclusive; those that have historically been white ‘will become’ diverse” [1]. Feminism in this perspective is about resolving old historical injustices.

However, feminist theory is not just about resolving historical injustices. It can also be about creatively exploring the limits and opportunities of technology, making the ordinary extraordinary through exaggerations and distortions, and with attention to the

(sometimes painful) details [6]. As bell hooks point out, theory is a liberatory practice, that heals when it challenges the status quo [21]. In her text “Feminist Wonder” Sara Ahmed [2] points out how it is the excitement to see the situation beyond our preconceptions about it, which is a central passion in a feminist practice motivated by affect, curiosity, wonder, and a desire to destabilize and alter structures. It is important here to point out that wonder and astonishment are not about happiness or distancing oneself from the ordinary, but to get in touch with how the ordinary is made, and to connect the personal experience with the political, using these painful glitches to disturb and destabilize unequal orders. When approaching a ‘queered’ expression of use with wonder and joy, we may not only critique the original form and its exclusions, but also discover category defying inspiration for novel design [3].

In this workshop, we therefore want to revisit our feminist roots, where theory is a liberatory and creative practice, and consider which of our theoretical tools we consider useful for making us feel amazed and misbehave. We embrace queer feminist HCI’s call for mess, variety, flexibility and sustainability [28]. The goal of this workshop is to create an inventory in the form of a toolkit of feminist theories and concepts that have had (or could have) an impact on our work as designers, educators, researchers, and activists, to see things differently and make a societal intervention. But we’re also curious about how design research and new digital tools, have influenced feminist theory.

Toolkits in HCI have themselves received critique for their prepotency for normative use [30, 39]. As a genre, toolkits consist of useful things with a script and accompanying epistemology of best practice in particular scenarios. In spaces such as HCI research, however, a singular ‘best practice’ cannot address sufficient complexities and challenges in a singular toolkit. Calls to incorporate feminist, queer, participatory ideas into the use of toolkits challenge the authority of a ‘best practice’, instead encouraging queer uses of the tools within [32]. In this spirit, we will treat these tools as objects whose value and purpose evolve with context, rather than as a stagnant expert recommendation.

3 WORKSHOP GOALS AND OUTCOMES

The goals of the workshop are to re-evoke our “feminist wonder” and strengthen the community of researchers and practitioners working at the intersections of feminist theory and CSCW. Specifically, we seek to identify and share theories and concepts which have destabilized our worldviews, and spurred curiosity and creativity, to further develop and strengthen our feminist discourse in a trustful environment. We also want to simplify and popularize our most useful tools and tricks, by among other things, in the form of a feminist research toolkit or manifest.

3.1 Pre-workshop Plans

Participants will be selected based on their submitted position papers (2–4 pages), where they suggest theories and methods grounded in their previous research to discuss at the workshop. These papers will be selected based on both their depth, and how they together with the other submissions represent a wide range of feminist perspectives. We hope to accept around 15–25 participants. We will

distribute a survey to accepted participants to inquire on any accessibility or safety needs, chosen names, and pronouns.

3.1.1 Small online groups the week before. The accepted position papers will be shared among the participants before the workshop, and as preparation for the workshop, participants are expected to read all papers and identify themes and theories. We will also share seminal works on feminist HCI and toolkits. Organizers will, based on the position papers, form smaller groups that meet online either synchronously or asynchronously a week prior to the workshop to synthesize themes that emerged from the position papers. This is also a way to get to know some of the other participants beforehand.

3.2 Schedule

8:30–9:00 Welcome: Coffee, snacks, and time to check presentation facilities. Online participants are welcomed by the two online platform hosts.

9:00–10:30 Introductions: Participants including organizers introduce themselves and briefly explain the role of feminisms in their research, and what they hope to gain from this workshop.

10:30 Identifying themes: We synthesize themes that emerged from the position papers and group discussions..

11:30 Break

12:00 Wondering together: Participants will organize into smaller groups around various themes, taking the analysis further in a brainstorming session, identifying similarities, paradoxes, and glitches between different methods and concepts.

12:30 Toolkit: Workshop participants begin to produce an outline for a feminist HCI “toolkit” summarizing the result of the day in a tutorial that provides some basic tools for feminist HCI (that can be developed further into a book).

13:30–14:00 Conclusion: Participants share their take-away from the day.

3.3 Post-workshop activities

To harbor a place for reflection and plan future activities, a shared document will be developed together the weeks following the workshop.

4 ORGANIZERS

4.1 Coordinator

Karin Hansson is an associate professor of media technology at Södertörn University. Dr. Hansson has written extensively about technology-based participation from a design and democracy perspective. She is currently project leader of the research project #MeToo Activism in Sweden (funded by the Swedish Research Council, no 2018-01824).

4.2 Team

Shaowen Bardzell is a professor in the School of Interactive Computing at Georgia Institute of Technology, where she is also the School Chair. She is known for her contributions in design, feminism, and technologies for social good in the field of Human Computer Interaction.

Aparajita Bhandari is a PhD candidate in the Department of Communication at Cornell University. Her work sits at the nexus of critical internet studies, feminist media studies and cultural theory.

Marion Boulicault is a feminist philosopher of science and technology, an Assistant Professor at the University of Edinburgh, and the Director of Interdisciplinary Research at the Harvard GenderSci Lab. Her research focuses on the normative dimensions of data collection and measurement practices.

Dylan Thomas Doyle is a PhD student in the Department of Information Science at the University of Colorado, Boulder. His research explores healthcare technology governance in oncology settings.

Sheena Erete is an associate professor in the College of Information at the University of Maryland, College Park, and founder and director of the Community Research and Design Collective. In her research, she explores and design technologies used by geographically-bound communities to address social issues.

Teresa Cerratto Pargman, is a professor in human-computer interaction at the Department of Computer and Systems Sciences at Stockholm University and an Associate Director for Outreach at Digital Futures in Stockholm, Sweden. Teresa is interested in the increasing digitalization and datafication of everyday societal practices from critical and data-feminist perspectives.

Shaimaa Lazem is an associate research professor at City for Scientific Research and Technological applications, Alexandria, Egypt. Her research projects include designing educational and heritage documentation technologies for the rural populations in Egypt. She is a Leaders-in-Innovation Fellow with the Royal Academy of Engineering in London since 2018, and the co-founder of the ArabHCI community.

Michael Muller works as a Senior Research Scientist at IBM Research on the historical and contemporary lands of the Wampanoag and Massachusett peoples, temporarily known as Cambridge MA US. He works in a hybrid intersection of HCI, AI, social science, and social justice, with current projects about the necessary role of autonomous humans in AI-based sociotechnical systems.

Maria Normark is an associate professor in HCI at Uppsala University, Sweden. Her research is focused on critical design, sustainability, and norm-critical perspectives in HCI and CSCW. Her work has been focused on sustainable activism through urban farming communities, discourses in femtech, and critical perspectives in personal informatics.

Adrian Petterson is a PhD student at the Faculty of Information, University of Toronto. They study networks of care in design through the lens of reproductive justice, abortion access, and social movements. They are also the node facilitator for Design Justice Network, Toronto.

Anton Poikolainen Rosén is a postdoctoral researcher at the School of Arts, Design and Architecture, Aalto University, Helsinki, Finland. His research focuses on designing for sustainable and just futures with a focus on more-than-human design and posthuman feminist perspectives. He is a part of the CHI network Feminist Voices about Ecological Issues in HCI.

Alex S. Taylor co-directs the Centre for Human-Computer Interaction Design at City, University of London. Showing a broad fascination for the entanglements between social life and machines,

his research ranges from empirical studies of technology in everyday life to speculative design interventions.

Jakita O. Thomas is a Philpott Westpoint Stevens associate professor of Computer Science and Software Engineering at Auburn University, USA. Her research interests include exploring the development of computational algorithmic thinking, and intersectional computing. She is a founder of Black ComputeHer which is an organization dedicated to supporting computing tech education and workforce development for Black women and girls.

Julia Watson is a PhD student in computer science at the University of Toronto. Her background is in linguistics and computer science, and her research integrates ideas from these fields to study how people and machines learn and use language.
