DESCRIPTION OF ARTWORK

Is there any other way for us to understand the world through Human and AI integration? *Understand_V.T.S.HAOS* is an installation that substitutes senses. It helps explore and ponder in the process of cultivation. This work conducts an experiment in which the possibility of the cooperation between natural and artificial algorithms is assessed, and serves as an approach to human enhancement. That is, it investigates how well our brains (natural) work with AI (man-made).

Permission to make digital or hard copies of part or all of this work for personal or classroom use is granted without fee provided that copies are not made or distributed for profit or commercial advantage and that copies bear this notice and the full citation on the first page. Copyrights for third-party components of this work must be honored. For all other uses, contact the owner/author(s).

Neuroplasticity allows our senses to perceive the world in various ways in which, for example, we might see not with our eyes, but with skin, or listen not through our ears, but through taste buds. “Skin vision” relies on the brain parsing pieces of information and thereafter shaping cognition. The project makes use of an object recognition system called *YOLO v3*. The recognized objects are then converted into the Braille reading system and written onto the skin of one’s upper leg. Additionally, the project produces a tactile image that is drawn directly on one’s back.

You can control a robot that wanders about your surroundings. The signals received by the robot’s left eye will translate the result of object detection to Braille and deliver it to your leg, while its right eye converts the signal received into the tactile image to your back. Eventually your brain will manage to comprehend the meaning of these signals, unlocking a new tactile cognition through Human and AI integration.

Consciousness is the reason why the world exists. Only when the universe is being observed by cognition will it emerge. *Understand_V.T.S.HAOS* probes into the intervention by machines in the augmentation of discriminative functions, exploring how to stimulate the perception of the tactile, and reconstructing how our brains perceive the world.

ARTIST INFORMATION

Lai Jiun-Ting was born in 1994 in Taipei. He focuses on the field of human-computer interaction. He is working creating futuristic human enhancements— the Orient Cyborg— assessing the possibility of cooperation between the human brain and artificial intelligence. He was awarded First Prize in the 13th Taiwan Influential Rookie Award and the 2018 Vision Get Wild Award, and he participated in 2020 Ars Electronica .ART Gallery and SIGGRAPH Asia 2020. Currently, he is participating in artist-in-residence programs at Taiwan’s Industrial Technology Research Institute (ITRI).
