Abstract

As Artificial Intelligence (AI) systems increasingly mediate the digital lives of youth, ensuring their online safety is an urgent priority. While HCI/CSCW scholars have explored participatory and ethical dimensions of AI, a critical gap remains: how to systematically integrate youth online safety experts, advocates, and young users themselves across the AI development lifecycle. This is especially imperative for Generative AI (GenAI), which introduces new risks such as dis/misinformation, deepfakes, and manipulative personalization that are difficult to anticipate or govern due to GenAI's underlying development paradigm (e.g., reliance on large training datasets designed for general purposes and result in unpredictable outputs). This workshop brings together interdisciplinary researchers, practitioners, and advocates to explore how expertise from child-centered domains can be embedded into GenAI development. We will collaboratively define the role of expertise in the AI lifecycle, explore how to operationalize multistakeholder collaboration, and identify future directions for building participatory-driven tools and methods. While GenAI is a core focus, the workshop welcomes broader AI and youth online safety perspectives. This workshop aims to develop actionable strategies for building AI systems that are not only innovative but also inclusive, ethical, and responsive to the needs and rights of youth.

CCS Concepts

• **Human-centered computing** → **Human computer interaction (HCI)**; • **Social and professional topics** → **Adolescents**.

1 Introduction

Artificial Intelligence (AI) systems are increasingly shaping the digital experiences of children and young people across education, entertainment, social platforms, and health technologies. Within the CSCW and HCI communities, researchers have begun to examine how AI uniquely affects youth, including its impacts on digital well-being [9, 19], privacy [11], online safety [2, 20], learning environments [1], and social relationships [26]. Children and teens are not only active users of AI-powered platforms but also among the most vulnerable to the risks these systems pose. Yet, youth online safety is often considered a peripheral concern in mainstream AI design, treated as a post-deployment issue rather than a foundational design principle [2, 11]. Moreover, experts in child development, online safety, and youth digital well-being are rarely positioned as central stakeholders in AI system development.

This challenge becomes even more pronounced with the emergence of Generative AI (GenAI) technologies. GenAI is rapidly transforming digital experiences, powering tools that can produce personalized content, conversations, and recommendations in real-time. From AI-generated learning companions and mental health chatbots to recommendation systems and creative tools, GenAI is being embedded into the very platforms youth use to learn, socialize, and express themselves [1, 15, 17]. While these innovations offer enormous promise, they also introduce new, complex risks,

including the spread of dis/misinformation [1], algorithmic amplification of cyberbullying [7], generation of Child Sexual Abuse Material (CSAM) [10], privacy breaches [7], and deepfakes [10]. Unlike earlier forms of AI, GenAI systems are autonomous, multimodal, and capable of producing unpredictable outputs [3, 25], making them harder to audit, govern, or moderate, especially in ways that account for the developmental, cognitive, and social needs of youth.

These shifts raise pressing questions such as: How do we build AI systems, especially GenAI, that proactively center youth online safety from the ground up? How can domain experts, such as youth online safety researchers, educators, clinicians, and advocates, be integrated into the entire AI lifecycle, not just consulted after harm occurs? And what participatory infrastructures are needed to ensure sustained, cross-disciplinary collaboration between AI practitioners, youth, and child-centered experts and advocates?

This workshop is grounded in the urgency of addressing these challenges, which requires a systematic, participatory, and multi-stakeholder approach [18]. We bring together researchers, designers, technologists, and youth advocates to explore how AI systems can be made to be safe, ethical, and inclusive of young users, particularly in the age of GenAI. Through structured dialogue and collaborative activities, we will explore methods, frameworks, and collaborative strategies that center the lived experiences of youth and the expertise of those working directly with them. While this workshop focuses on the unique risks posed by GenAI, it invites broader engagement from anyone working at the intersection of AI and youth online safety. We aim to create a space where diverse expertise can coalesce into actionable strategies that support ethical, participatory, and youth-centered AI development.

This event builds on the momentum of the CSCW community's prior work on participatory and responsible AI [12–14, 23], particularly the 2023 workshop titled "Community-Driven AI: Empowering People Through Responsible Data-Driven Decision-Making" [24], which examined user participation in auditing and contesting AI systems. This iteration deepens that conversation by focusing on the operational integration of youth online safety expertise into the evolving landscape of AI and GenAI development. Ultimately, we will explore not only shared concerns but also tools, practices, and relationships that enable us to build AI systems where youth are not just passive recipients but active, protected, and empowered participants.

2 Defining the AI Ecosystem

AI system development is a complex, human-driven process typically described through five interrelated phases of the AI lifecycle (see Figure 1) [16]. While the lifecycle itself is well-defined, the roles and involvement of various stakeholders remain ambiguous. Research shows that community members and end-users are often engaged only in the later stages—such as deployment—to assess impact [5, 8, 14]. This is especially evident in online safety research, where affected communities are rarely included during the design and development phases [22]. As a result, these groups have limited influence over system design and risk mitigation, often leading to protections that fail to meet their needs. Stahl [21] emphasizes that those most affected by AI are frequently the least empowered to

Figure 1: Integration of Experts into the AI Lifecycle.

shape it. Addressing this gap through early inclusion of diverse experts could lead to more trustworthy, effective, and equitable AI systems.

3 Workshop Themes

We selected these three themes to foreground the structural, methodological, and relational gaps that often prevent youth-centered expertise and other domain experts from shaping the AI systems that deeply affect young people's lives. Each theme reflects a critical dimension of this challenge: how we define and value different forms of expertise, how we build sustainable and equitable collaborations across sectors, and how we develop concrete tools and methods to support meaningful participation.

Theme 1: Defining Expertise and Participation in AI Development for Youth Online Safety

As AI continues to shape youth digital experiences, questions of whose expertise informs these systems grow more urgent. Technical voices often dominate AI development [6], sidelining youth online safety researchers, child development experts, advocates, and youth themselves [4]. This theme explores how expertise is defined, validated, and included in AI design. It invites reflection on structural and disciplinary forces that shape participation, and how lived and child-centered expertise can be integrated as co-creators, not just reviewers or users. Key questions include: *Where in the AI lifecycle are youth and advocates currently involved? What norms determine whose expertise counts? What infrastructure supports integration of experiential knowledge? What barriers limit inclusion of nontechnical perspectives?*

Theme 2: Operationalizing Multistakeholder Collaboration in GenAI for Youth Online Safety

While many AI ethics frameworks advocate for stakeholder engagement, few offer concrete strategies for how to sustain multistakeholder collaboration across the GenAI lifecycle, especially in high-stakes domains involving children and teens. This theme explores what it takes to build equitable, long-term partnerships between AI practitioners, youth online safety experts and advocates, researchers, policymakers, and youth themselves. It considers the

logistical, institutional, and cultural barriers to collaboration, and how these might be addressed through new tools, processes, or governance structures. In particular, we seek to explore approaches that move beyond “checking a box” participation [cf. 5] and toward truly reciprocal, ongoing relationships that shape how GenAI systems are imagined, designed, tested, and governed. Questions we will cover under this theme include: *What models currently exist for sustained, cross-sector collaboration on AI systems that impact youth? How can we design workflows, incentives, or shared infrastructures that support long-term engagement across disciplines? How do we move beyond one-off consultations toward sustained and meaningful engagement? What kinds of organizational, legal, or funding mechanisms are needed to support this collaboration?*

Theme 3: Collectively Defining Future Research Directions in Developing Tools and Methods to Support Participation in GenAI

Building safe and inclusive GenAI systems for youth requires more than intention; it requires tools and methods that are designed to facilitate meaningful, structured participation. This theme invites participants to envision a future research agenda that addresses this need collectively. It focuses on identifying methodological gaps, adapting participatory approaches from CSCW and HCI, and exploring how GenAI’s specific characteristics (e.g., unpredictability, multimodality, personalization) complicate standard design practices. Our goal is to examine not only how to include diverse voices but also how to equip AI practitioners and domain experts with the participatory tools, methods, and metrics they need to engage effectively throughout the development cycle. This theme captures the following questions: *What are the appropriate methods and degrees of participation across different phases of the GenAI lifecycle? How can existing frameworks be operationalized to support youth-centered participation? What tools, methods, and metrics are needed to evaluate the quality and impact of participation in GenAI?*

4 Call for Participation

This one-day workshop aims to explore the intersection between youth online safety research and expert participation in the design, development, and evaluation of AI. We invite researchers, practitioners, policymakers, community partners, and other stakeholders with an interest or experience in youth online safety, and applying participatory methods and approaches in designing, deploying, and evaluating societal impacts of AI technologies. Interested participants will be asked to contribute a brief statement of interest.

Submissions can take one of the following formats:

- (1) A short bio with a statement of motivation/interest for attending the workshop.
- (2) A position paper contributing insights to one or more of the proposed themes.
- (3) A case study describing ongoing or completed work involving participatory approaches to GenAI or youth online safety in AI systems.

Submissions should be no longer than four pages of content including figures (excluding references), submitted in PDF according to the ACM templates used by the CSCW conference (see <https://cscw.acm.org/2025/index.php/submit-papers/>) with author names included. Since workshop submissions are non-archival, we

encourage participants to send their work in progress that has been submitted in previous venues. Each submission will be reviewed by at least two organizers, with acceptance based on relevance to workshop themes, quality of ideas, and potential for contributing to collaborative discussions. We encourage submissions from individuals of diverse backgrounds, expertise, and experiences.

5 Workshop Logistics

5.1 Pre-Workshop Plans

(1) Publicizing the CFP, Website, and Slack Workspace: We will publicize the workshop via ACM, AI, NLP, and HCI mailing lists and social media (LinkedIn and X). We will also reach out to scholars, members of civil society groups who have experience implementing participatory AI, developers of responsible AI tools, and policymakers who have developed AI frameworks to encourage them to submit their work. Our website¹ will provide the call for participation, workshop aims, agenda and outcomes, organizers’ short bio, and contact information. We will also set up a Slack workspace to build a community for continued discussion and sharing of relevant research.

(2) Virtual Pre-Workshop Session: Approximately two weeks before the conference, we will host a virtual session introducing one of the workshop’s core themes. This session will provide an opportunity for early engagement with the topic, allowing participants to begin forming connections, share preliminary insights, and shape the in-person discussions. We see this virtual session as a critical step toward making the workshop more inclusive and accessible, especially for those who may face travel or scheduling constraints.

5.2 In-person Organization

This in-situ workshop is designed to foster rich collaboration, hands-on engagement, and informal knowledge-sharing. We aim to host 20–30 participants in an inclusive and welcoming environment that encourages cross-disciplinary interaction. Breakout sessions and design activities will be held in shared physical spaces, with discussions captured using sticky notes and collaborative tools like Google Docs/Slides. To ensure accessibility, we will offer flexible group formats that support meaningful participation across career stages.

5.3 Workshop Outcomes

The expected workshop outcomes include:

- (1) **Mapping** the current landscape of theories, methods, and frameworks for integrating youth online safety expertise across stages of the AI and GenAI lifecycle.
- (2) **Synthesis** of key challenges and opportunities to support youth-centered participatory approaches in responsible AI development.
- (3) **Strengthened** connections between researchers, practitioners, and advocates working on AI, youth online safety, and participatory design.
- (4) **Collaboratively** defined research agenda outlining future directions for integrating domain expertise in youth-focused AI systems.

¹Workshop Website

Table 1: Workshop Activities

Session	Description
Welcome and Introductions (20 min)	Overview of the workshop’s goals, structure, and key themes, followed by an icebreaker to introduce participants.
Speed Networking (20 min)	Participants engage in rotating 5-minute pairings to reflect on shared interests and foster interdisciplinary connections.
Breakout Session – Theme 1 (40 min)	Focused on defining expertise and participation in AI. Small groups will map current roles and identify gaps in youth-centered participation across the AI lifecycle.
Group Debriefing (15 min)	Participants reconvene for a short debrief on the first breakout session.
Coffee and Networking Break (30 min)	Informal networking opportunity over coffee.
Breakout Session – Theme 2 (40 min)	Focus on operationalizing multistakeholder participation in AI. Groups will use sticky notes or slides to co-create affinity diagrams mapping challenges and opportunities.
Group Debriefing (15 min)	Participants reconvene for a short debrief on the second breakout session.
Lunch Break (120 min)	Extended break for lunch and informal networking.
Breakout Session – Theme 3 (40 min)	Groups will discuss future directions for tools and methods that support youth participation in AI development.
Group Debriefing (15 min)	Participants reconvene for a short debrief on the third breakout session.
Coffee and Networking Break (30 min)	Second informal networking break.
Synthesis Session – Call to Action (60 min)	A large-group collaborative session to synthesize insights from earlier sessions and generate opportunities for future collaboration.
Conclusions and Next Steps (25 min)	Discussion on concrete follow-up actions such as future convenings, collaborative writing, or coalition-building.

5.4 Post-Workshop Plans

After the workshop, we plan to continue engaging the stakeholders and sharing outcomes through the following activities:

- (1) **Reconnecting**, sustaining, and continuing discussions using the collective directory created for the workshop. We will invite volunteer participants who would like to keep the conversation alive in the directory.
- (2) **Publishing** a summary report of workshop insights and recommendations to guide practitioners and researchers in integrating youth online safety expertise into AI/GenAI development, published on our website and public platforms (e.g., Medium, social media).
- (3) **Proposing** a special issue for *ACM Interactions* or a related venue highlighting key roles, tools, and participatory strategies for building responsible and inclusive AI systems that prioritize youth well-being and safety.

6 Workshop Activities

We propose a one-day hybrid workshop, held in person at CSCW 2025 with virtual participation options to ensure broad inclusion of perspectives. The final schedule will align with conference timing and incorporate meal and coffee breaks. See workshop schedule in [Table 1](#).

7 Workshop Organizers

Our team of organizers is comprised of students, faculty, and industry professionals who bring unique expertise and vision to the topic of Expert Participation in AI and Youth Online Safety. Details about the workshop organizers can be found in [Table 2](#).

Table 2: Workshop Organizers

Name	Bio
Ozioma C. Oguine	PhD student at Univ. of Notre Dame. His research investigates how AI technologies and online platforms can be designed to better protect and empower young users, particularly in relation to online safety, digital well-being, and algorithmic harms.
Johanna Olesk	PhD student at Univ. of Notre Dame. Her research is focused on designing technological interventions to improve the online safety of vulnerable youth populations, such as youth in foster care.
Jaemarie Solyst	Postdoc at Univ. of Washington. Her research is on emboldening young people in the age of AI with critical AI literacy and youth-inclusive participatory responsible AI processes.
Michael Madaio	Senior Research Scientist, Google Research in the Center for Responsible AI and Human-Centered Technology. His research draws on methods from human-computer interaction to develop tools and processes to lead to the development of responsible AI.
Michael Muller	Senior Research Scientist, IBM Research in the Human Centered AI group, where he focuses on human-AI co-creativity. His prior work included papers on ethical and anti-colonial AI, and an encyclopedic handbook chapter on participatory methods (including methods designed for children as co-designers).
Adriana Alvarado Garcia	Staff Research Scientist, IBM Research, working with the Responsible Technologies research team. Her current research focuses on examining the data work practices of practitioners when developing Large Language Models (LLMs). She develops methods and tools to mitigate data-related risks associated with the social harms of LLMs from a socio-technical perspective.
Karla Badillo-Urquiola	Clare Boothe Luce Assistant Professor, Univ. of Notre Dame. She leverages her interdisciplinary expertise to investigate technology-driven solutions that empower people and protect the well-being of youth in marginalized communities, drawing on participatory and critical design methods.

Acknowledgments

Dr. Badillo-Urquiola's research is made possible in part by the Notre Dame-IBM Technology Ethics Lab. The Technology Ethics Lab drives ethical and human-centered design, development, deployment, and use of technology.
