ABSTRACT

There has been a growing body of work on migration within the HCI community, as well as within the social science and public policy communities. More specifically, human-centered security researchers have been exploring the needs and concerns of migrants, starting to contend with the harms created by digital technologies and experienced by those who are and have been marginalized. Case studies through which migration and (digital) security within the HCI domain intersect have been localized to specific contexts such as, e.g., particular issues related to data processing and sharing in refugee camps, or a narrow set of security threats and harms experienced by migrant workers in their new places of work. However, more holistic approaches to understanding the intersections of migration and (digital) security are yet to be fully explored while accounting for the *past* (including home country security practices, use of localized digital technologies, and interactions with technologies throughout the migration journey), the *present* (current security practices and experiences in the place or country migrants

are situated), and the *future* migrants are trying to secure for themselves and their families. This workshop aims to build a community of HCI researchers interested in how migration and (digital) security intersect to braid together research narratives, perspectives, and methods, design for inclusive technologies, and build an agenda for future research and practice.

CCS CONCEPTS

• **Security and privacy** → **Social aspects of security and privacy**.

1 INTRODUCTION

The act of migrating to new countries – whether by choice or forced – has a long history and is expected to increase as societies contend with climate crises, conflicts, and socio-economic and political inequities. Sabie et al. [26, 28] emphasize the need to diversify narratives of migration and related HCI research, to not only account for the experiences of migrants like refugees and asylum seekers but also international students and migrant workers, including gig workers such as domestic childcare workers and house cleaners, who also face technological border controls [21] and the uncertainties of resettlement [33]. HCI research has engaged with the topic of migration identifying how technologies are being used by migrants [6], support migrants in accessing healthcare [9], employment [30], and social capital [6], as well as help migrants adapt to the new countries they have resettled in [15]. Additionally, research has explored ways through which technologically-mediated connections among migrants can support them in meeting their immediate needs, helping them build community support networks (both online and offline) [33], fostering reciprocity among migrant communities, and infrastructuring hope [16]. Using co-design methods, the efficacy of technologies in improving mental health and well-being in contexts of migration has been interrogated [35], as well as the ways artifact-driven storytelling may enable heritage sharing and rapport building within migrant communities [27].

A growing body of work has been concerned with issues at the intersections of migration and different notions of security – including digital, ontological, human, and social security – within the HCI domain. Krüger et al.'s workshop [20] challenged HCI researchers to consider how technologies are both used to secure borders against migration as well as secure migration routes by migrants crossing borders. The duality of technologies in both enforcing borders and supporting the survival of those attempting to cross borders has further been documented [29]. Moreover, the interplay between refugee experiences and technologies deployed by humanitarian aid systems and governments has been explored through an ontological security lens; research has highlighted how, by attempting to secure aid, aid technologies reduce refugee capabilities in securing their communal practices [38] and often result in experiences of insecurity that refugees have to adapt to and navigate [39]. Additionally, the digitalization of refugee resettlement processes in many host countries (in Europe) adds pressures on migrants to always remain connected [11], while introducing new everyday security threats, harms, and vulnerabilities [19]. Research has also shown that in the precarious contexts of migration and resettlement, digital security becomes less of a primary concern for migrants who feel they have no choice but to forgo security in favor of accessing services [10] and aid [31]. Simko et al. [32] found that refugees who resettle in the US heavily rely on their case managers to help them use required technologies (e.g., email) to access services that support them in establishing their lives and finding employment. This reliance on others for access as well as the pressures and uncertainties underpinning experiences of (re)settlement make established digital security practices infeasible or push them to the side-lines. Slupska et al. [33] also found that the threat of government surveillance and deportation due to data harvesting [42] may stop migrants from

reporting labor exploitation and/or sexual violence or from accessing essential services like healthcare. However, Guberek et al. [13] found that among undocumented immigrants in the US, practices of addressing offline security threats are not necessarily paralleled online, while understanding of online government surveillance is vague. In contrast, Steinbrink et al.'s [34] work in Germany showed that asylum seekers are often aware of surveillance, extortion, and persecution risks tied to the use of smartphones and other ICTs. Slupska et al. [33] and Bernd et al. [7, 8] found how security and privacy risks that migrant domestic workers are exposed to are further compounded by employers excessively monitoring them through the use of Internet of Things (IoT) technologies within their places of work. Lastly, the online privacy concerns of first and second generations of immigrant Muslim-American women have been shown to be shaped by intersectional dimensions of identity, namely gender and religion [3].

The above literature points to the increased security and privacy concerns, pressures, and harms experienced by migrants at different points in their migration journeys and grounded in their specific contexts. This body of work, thus, provides a fertile ground and a starting point for exploring and discussing how migrants' digital and other forms of security practices change as they navigate security threats with different actors, such as home and foreign governments, humanitarian organizations, and employers, throughout their diverse and distinct journeys.

2 WORKSHOP GOALS

Our goal is to collectively explore how digital security interacts with other forms of security impacting migrants, such as geopolitical, ontological, human, and social security. The workshop will also adopt a wide definition of migrants including but not limited to refugees and asylum seekers, international students, economic migrants, first- and second-generation migrants, and undocumented (or illegalized) migrants, as well as migrants transitioning in-between the aforementioned imposed categorizations. To meet our goal, the workshop will work toward three objectives. First, we want to bring together a community of HCI researchers, as well as researchers belonging to social science and public policy, working on topics related to: (1) (digital) security, as well as the threat landscape created by technologies, among marginalized communities in western and non-western contexts [2], (2) migration and use of technologies, and (3) e-government, given the dominant and proximal role that the digitalization of border controls and public services plays in migration experiences. Second, we will explore and map how HCI research and narratives of migration and (digital) security intersect and interplay with one another through a longitudinal lens of migration journeys. Third, the workshop will provide a safe and critical space through which knowledge of migration and (digital) security can be brought into conversation to identify areas for future inquiry.

2.1 Workshop Areas of Focus

Based on surveying the literature and conversations with other scholars in previously-organized Special Interest Groups and workshops [1, 20, 28, 36, 37, 40, 41], as well as our collective knowledge in the spaces of digital security and privacy, migration, and

e-government, we have identified four areas of focus with regard to migration in which migrants face digital encounters that may shape their security practices. Our four summarized areas of focus below that account for three temporal segments of any migration journey – the past, present, and future – will provide a point of reference for workshop participants. The workshop is also open to other areas of focus that sit at the intersections of migration and security.

2.1.1 Home countries, communities, and lands. The (digital) security cultures and practices constructed in migrants' home countries are shaped by several factors. To name a few, factors can include cultural norms and values [2], access to and sharing of digital technologies [4], governmental use of technologies within everyday lives [18], e-banking [22], encounters with techno-surveillance and/or the lack thereof [17], and use of technologies within states of conflict and revolution; e.g. within protests [5] and war [25].

2.1.2 Migration journeys. The digitalization of migration journeys and migration controls introduces new digital security risks and vulnerabilities, as presented in §1, whether through documented and/or undocumented routes. For example, applying for visas and work permits and resettlement processes have been increasingly digitalized through the collection of biometrics [24]. Furthermore, technologies like mobile phones are used by migrants to navigate the crossing of borders as well as to control borders by governments, especially in Europe [29]. Mobile phone data extraction has been increasingly used by governments in Europe. Similarly, drones and other automated technologies at borders increasingly target migrants as technologies of deterrence rather than rescue. Many of these technologies are deployed in the name of national security and lack public accountability or scrutiny. Moreover, they are produced by private actors, which view governmental authorities, not migrants, as their users [43]. Additionally, social media and online forums have been reported as sources of peer learning and knowledge exchange for those seeking to migrate, to help plan migration pathways and destinations [12].

2.1.3 Resettlement in host countries and/or permanent transitional spaces. As detailed in §1, HCI research has highlighted the (digital) security threats experienced by migrants in their host countries as well as in refugee camps and settlements that are spaces intended to be transitional but become a state of permanence. This also encompasses settling in new communities, educational systems, and places of employment [6].

2.1.4 Inclusive technology design. Cutting across the above areas of focus is that of inclusive technology design in relation to security. Prior work has mainly examined the views, privacy concerns, and choices of the owners and primary users of IoT technologies. Recently, secondary users and bystanders have received more attention from HCI and computer security research communities, motivated in part by research on multi-party smart homes and shared housing. Yet, bystanders such as migrants are rarely considered in security and privacy threat models, which primarily focus on technology owners. Ślupska et al. [33] argue that technology designers and developers should view migrants as people who deserve security and privacy in their own right. Otherwise, forms of

marginalization and power imbalances in societies will continue to persist.

3 WORKSHOP ORGANIZERS

The workshop organizers come from different backgrounds and are at different academic career stages. Their work speaks to different fields spanning cybersecurity, privacy, HCI, design, social science, and public policy. All organizers have contributed to and conducted HCI research with vulnerable and/or marginalized populations in different settings, including migrants, to understand how current digital technologies affect these populations. Further, all have organized and facilitated workshops and events – at ACM CHI and other ACM and non-ACM facilitated venues – that aim to build communities around topics at the forefront of migration, HCI, and (digital) security (e.g., [1, 20, 28, 36, 37, 40, 41]).

Ruba Abu-Salma is an Assistant Professor of Computer Science at King's College London (KCL), affiliated with the Cybersecurity Group and the Human-Centered Computing Group. She aims to understand and improve people's security, privacy, and safety decision-making processes, with a focus on vulnerable and/or marginalized populations, including migrant domestic workers.

Reem Talhouk is an Assistant Professor of Design and Global Development at Northumbria University within the Design Feminisms Research Group, Cocreate, and the Global Development Futures Hub. Her research focuses on humanitarian technologies, technologies of revolution, and decolonial design.

Jose Such is a Professor of Computer Science at KCL, affiliated with the Cybersecurity Group. His research takes a human-centered approach to understanding online harms like discrimination and building systems that are secure and privacy-respecting.

Claudia Aradau is a Professor of International Politics in the Department of War Studies at KCL and Principal Investigator of the ERC Consolidator Grant "Security Flows", exploring how data is generated, exchanged, and contested in border encounters.

Francesca Meloni is an Assistant Professor of Social Justice at KCL. Her research focuses on contemporary processes of migration and social exclusion.

Shijing He is a Ph.D. student at KCL who works with smart home technology developers to design for inclusivity, in particular for migrant families (including migrant workers and their left-behind children), standing at the crossroads of HCI and usable privacy.

Syed Ishtiaque Ahmed is an Assistant Professor at the University of Toronto, researching migration and technologies in Bangladesh and Canada.

Cansu Ekmekcioglu is a Ph.D. candidate in information science at the University of Toronto. Her research investigates interactional, informational, organizational, temporal, and cultural experiences of socio-technical systems with policy, design, and development implications. Her current work looks at the use of digital technologies in humanitarian and resettlement contexts with a geographical focus on Canada and the Middle East, including Turkey.

Dina Sabie is a Ph.D. candidate in computer science at the University of Toronto. Her research explores design approaches to supporting intercultural exchange between migrants and host communities, as well as among migrants of different backgrounds. She

has engaged with immigrants, refugees, and internally-displaced people at various sites around the globe, with a focus on Canada and Iraq.

Rikke Bjerg Jensen is a Reader at Royal Holloway, University of London (RHUL). She researches information security at the margins of societies, including in contexts of migration and political/human-rights protests.

Jessica McClearn is a Ph.D. student at RHUL who researches experiences of insecurity within contexts of infrastructural degradation.

Anne Weibert is a Research Associate at the University of Siegen and conducts research at the intersection of migration, intercultural learning, and technologies.

Max Krüger is a researcher at the University of Siegen and has been exploring the role and longevity of technological interventions to support refugees and forced migrants in their efforts to make themselves at home in Germany.

Faheem Hussain is a Clinical Associate Professor at Arizona State University and has been exploring digital security of the Rohingya refugees.

Rehema Baguma is a Senior Lecturer in Information Systems at Makerere University and conducts research on e-government and the digitalization of public services.

4 LINK TO WEBSITE

We will be updating our webpage <https://migrationsecurityprivacy.uk/> with the call for participation, information about attendance, and workshop agenda.

5 PRE-WORKSHOP PLANS

We will advertise the workshop targeting audiences with a wide range of interests inside and outside the HCI field. We will also reach out to both early and established researchers, academics, designers, practitioners, activists, and policymakers. To achieve this, we will use different methods to publicize our workshop and distribute the call for participation (see §8) via relevant mailing lists, social media platforms, and organizers' personal connections with different communities, service provider organizations, and charities. We will ask participants interested in taking part in our workshop to submit four-page position papers. Suitable contributions include work-in-progress, concrete research ideas, novel research methods and perspectives, and reflective pieces. The workshop organizing team will review all submissions and select those based on their relevance to the workshop, originality, significance, and quality. We will post accepted position papers on the workshop website before the workshop date. We aim to recruit between 15 and 25 participants, targeting attendees coming from diverse backgrounds, geographies, and professions.

To facilitate accessibility and account for potential Internet connectivity issues, we will ask the authors of each accepted position paper to record a five-minute video representative of their position paper and add closed captions to their recording before sending it to us ahead of the workshop day. The workshop will be a hybrid event. We will ask both virtual and in-person attendees to watch the recordings prior to the virtual and in-person components of the workshop. We will also create a Slack channel for the workshop

where the videos will be shared, and workshop co-organizers will prompt discussions prior, during, and after the workshop.

6 WORKSHOP STRUCTURE

To ensure that the workshop is accessible to those who intend to attend and participate remotely, the workshop will be divided into two components. The first is the virtual component that will be held prior to the in-person component. The virtual four-hour workshop will be hosted on Zoom and will be facilitated using Miro, an interactive online whiteboard. The timing of the virtual workshop will be determined based on the time zones from where attendees will be joining. We will use our institutional Zoom and Miro licenses for the workshop. The second component is the in-person workshop taking place at the CHI'23 venue. Attendees of either of the components will engage in the same activities as detailed in §6.2.

6.1 Connecting the virtual workshop to the in-person workshop

In order to connect the virtual workshop discussions and attendees to those of the in-person workshop, we will first record (with attendees' consent) the activities of the virtual workshop in which attendees present back to the wider group, and we will then share those activities on the Slack channel prior to the in-person workshop. We will also print materials generated by virtual attendees and share them with in-person attendees as materials they can engage with and build on as they participate in the in-person workshop activities. Additionally, during the in-person workshop, we will maintain a Zoom room that will be opened during the 'Welcoming notes and introductions' as well as Activities 2, 4, 5, and 6 for remote attendees to join the discussions with in-person attendees. We will share the recordings of the groups presenting back in the in-person workshop on Slack, so that remote attendees can engage with them and initiate conversations outside the workshop.

The workshop organizers have attended a number of virtual events, and some have experience in organizing both in-person and virtual conferences and workshops. For example, Reem Talhouk co-chaired the 2022 Participatory Design Conference Places track that asynchronously and synchronously connected attendees and decentralized activities taking place in 16 countries to the conference [23]. Also, Ruba Abu-Salma and Jose Such co-organized the 2022 PETS Workshop on Interdependent and Multi-party Privacy, which was a hybrid event [14].

6.2 Workshop activities

The workshop will start with a round of introductions in which attendees introduce themselves and the work presented in their position papers. Attendees will then be grouped into the relevant areas of focus (as detailed in §2.1). In their groups, attendees will be asked to engage in discussions and generate stories of migration, technology, and security that engage with the workshop areas of focus and build on their knowledge, research, and experiences. The stories will be documented in formats attendees deem suitable (e.g., written text, sketches, scripts) (Activity 1). Attendees in different groups will then be brought back together where they will

present the stories they have generated (Activity 2). After presenting back, attendees will be asked to identify from their collective stories themes of (in)security that can be further unpacked through a longitudinal lens of migration and migration journeys (Activity 3). Attendees will then again be divided into groups based on the themes of (in)security where they will be asked to map each theme along a migration journey of their choice (e.g., migrating for international studies, economic migration, asylum seeking) and flesh out the theme accordingly (Activity 4). Attendees will then be brought back together to present their mappings and discussions (Activity 5), and then we will collectively generate a table of contents for a journal special issue on migration & security (Activity 6). The activities in which virtual attendees will be sharing what they have done in their groups will be recorded and shared with in-person attendees and vice versa. Activities during the in-person workshop have been allocated more time (see Table 1 on the next page) to give in-person attendees the opportunity to engage with the materials generated during the virtual workshop.

7 POST-WORKSHOP PLANS

We will post all documentation of accepted position papers, workshop activities and outputs, and a recap of activities and discussions on the workshop website. We will keep the website updated and accessible, acting as a resource for future research and practice. We will also invite interested participants to discuss further with us how to work toward a publication in a TOCHI journal special issue exploring the interplay between HCI and (digital) security in the lives and journeys of migrants, to inform the design of current and future technologies.

8 CALL FOR PARTICIPATION: CHI'23 WORKSHOP ON DIVERSE MIGRATION JOURNEYS AND SECURITY PRACTICES

Migrants' security practices are shaped by their encounters of (in)security in their home countries, during their migration journeys, and in their new places of resettlement. In this workshop, attendees can collectively create a vision for exploring holistic approaches to understanding the intersections of migration and (digital) security.

The workshop will have virtual and in-person components. We invite researchers, practitioners, and policymakers to submit position papers discussing work-in-progress, research ideas and methods, and reflective perspectives. Topics include but are not limited to:

- Understanding the (digital) security practices in migrants' home countries.
- Exploring the (digital) security practices experienced throughout diverse migration journeys.
- Investigating the challenges (including security threats) faced by migrants in their places of resettlement.
- Discussing inclusive technology design in relation to migration and security.

Submission guidelines. Four-page position papers (including references) must follow the ACM Master Article Submission Template format: <https://chi2023.acm.org/submission-guides/chi->

[publication-formats/](#). Position papers must be submitted as PDFs to CHI23MSP@gmail.com.

Submissions will be reviewed and selected based on their relevance, originality, and significance. Upon acceptance, at least one author must register for the workshop (by attending remotely and/or in-person), prepare a five-minute video, and send a list of topics to be discussed. We will post accepted papers/videos on the workshop's website: <https://migrationsecurityprivacy.uk/>.

Deadlines.

- Early Submission Deadline: February 1, 2023.
- Early Notification: February 6, 2023.
- Final Submission Deadline: February 13, 2023.
- Final Notification: February 20, 2023.
- Camera-Ready Draft and Presentation Video Deadline: March 29, 2023.
- Virtual Workshop Day: April 15, 2023.
- In-person Workshop Day: April 28, 2023.

Time in minutes (virtual)	Time in minutes (in-person)	Activity
00' – 20'	00' – 30'	Welcoming notes and introductions
20' – 50'	30' – 70'	Activity 1: Generating stories of migration, technologies, and security
50' – 60'	70' – 80'	Short break
60' – 85'	80' – 110'	Activity 2: Groups reporting on the topics discussed in each group
85' – 105'	110' – 140'	Activity 3: Identifying themes for further exploration
105' – 130'	140' – 175'	Activity 4: Mapping and developing themes across diverse migrations
130' – 175'	175' – 265'	Long lunch break
175' – 200'	265' – 295'	Activity 5: Groups reporting back on topics discussed
200' – 230'	295' – 330'	Activity 6: Generating a table of contents for a TOCHI journal special issue
230' – 240'	330' – 340'	Wrap-up and next steps

Table 1: Workshop structure.
