Abstract

The objective of the 6th ACM International Workshop on Earable Computing (EarComp 2025) is to provide an academic forum and bring together researchers, practitioners, and design experts to discuss how sensory earables technologies have and can complement human sensing research. It also aims to provide a launchpad for bold and visionary ideas and serve as a catalyst for advancements in this emerging new Earable Computing research space.

CCS Concepts

• **Human-centered computing** → **Ubiquitous and mobile devices; Ubiquitous and mobile devices**; • **Computing methodologies** → **Machine learning algorithms**.

Keywords

Earables; Human Sensing; Behaviour Analysis; Data Systems

1 Background

Sensory earables are increasingly becoming a mainstream computing platform with a promise to fundamentally transform personal-scale human sensing applications. Over the past few years, a number of research efforts in the ubiquitous computing domain have sought to achieve useful, engaging, and sometimes ambitious behavioural analytics with sensory earables including studies of the human face; of emotion and stress; continuous monitoring of cardiovascular function; oxygen consumption and blood flow; and tracking eating episodes as well as dietary and swallowing activities. At the same time, we have started seeing commercial efforts such as Apple

AirPods, Bragi's The Dash, Bose SoundSport, Jabra Elite Sport, and Sony Xperia, Beats Powerbeats Pro 2 offering music experience augmented with sensory services including fitness tracking, real-time translations and conversational agents. Naturally, earables are becoming an intense interdisciplinary area of study with many and diverse applications including HCI, empathic communication, behavioural science, health and wellbeing, entertainment, education, and security.

However, as of today, earable computing lacks an academic forum to bring together researchers, practitioners, and design experts from academia and industry to discuss, share, and shape this exciting new area of research. To this end, we want to organise the sixth edition of the ACM Workshop on Earable Computing with a hope that this workshop will serve as a catalyst for advancements in sensory earable technology as well as present a clear sense of direction for the research community to proceed in this space.

As a launchpad, in 2018, we leveraged the Open Earable Platform, eSense (<http://www.esense.io>), from Nokia Bell Labs. These devices are being shared with 70+ academic institutions to accelerate the research in this space. In particular, we expect the workshop will include participants from these institutions reporting on their research with sensory earables to bootstrap this community. For the sixth edition of the workshop, we will also consider research contributions which do not build on top of eSense but present innovative developments with other earable devices.

2 From eSense to OmniBuds and the Earable Computing Community

Nokia Bell Labs Cambridge developed an open earable computing platform called *eSense* in 2019. *eSense* provides a high-definition stereo earable equipped with a microphone, a 6-axis inertial measurement unit, and dual-mode Bluetooth. It allows recording of real-time data streams of three modalities: audio, motion, and proximity. The platform (hardware and associated software libraries) is being widely shared with 70+ academic groups active in the areas of ubiquitous, mobile and wearable systems research. These groups heavily contributed to building a community around earable computing by sharing:

- curated and labelled datasets collected with *eSense* across a variety of projects; and
- models using these datasets.

<https://doi.org/10.1145/3714394.3750578>

For the past years, the eSense portal (<http://www.esense.io>) has been the central point of access for this community, and has hosted project descriptions, links to data and models, relevant publications of different research groups as well as the EarComp workshops web-pages, facilitating the development of an active community space.

Following the success of eSense, at EarComp 2023 the team at Nokia Bell Labs Cambridge announced OmniBuds. OmniBuds is finally available and is being shared with leading academic groups worldwide. It is the world's first sensory earable platform uniquely designed to continuously monitor all five vital signs, complemented by state-of-the-art acoustic context capabilities. Powered by an AI-native programmable operating system, OmniBuds offers a robust 6-hour battery life, on-device data collection, and privacy-preserving processing. OmniBuds serves as a research-oriented and human-centered platform, designed to push the boundaries of what was possible with eSense, to further advance earable computing research from the laboratory into everyday life.

3 Scope, Submissions, Structure and Sessions

3.1 Call for Papers

We will solicit three categories of papers. **Full papers** (up to 6 pages including references) should report a reasonably mature work with earables, and is expected to demonstrate concrete and reproducible results albeit scale may be limited. **Experience papers** (up to 4 pages including references) that present extensive experiences with implementation, deployment, and operations of earable-based systems. Desirable papers are expected to contain real data as well as descriptions of the practical lessons learned. **Short papers** (up to 2 pages including references) are encouraged to report novel, and creative ideas that are yet to produce concrete research results but are at a stage where community feedback would be useful. Moreover, in this latter category, we encourage the submission of "Dataset Paper" - soliciting a 1-2 page document describing a well curated and labeled dataset collected with earables (eventually accompanied by the dataset).

All research papers will be in ACM sigconf template with 2 columns and the accepted papers will be included in the ACM Digital Library. All papers will be digitally available through the workshop website, and the UbiComp adjunct proceedings. We will offer a "Best Paper" award sponsored by Nokia Bell Labs. In addition, depending on the quality and depth of the submissions we might consider producing a Book on "Earable Computing" contributed by the authors of the papers, and edited by the Workshop Organizers.

Topics of interest:

- Acoustic Sensing with Earables
- Kinetic Sensing with Earables
- Multi-Modal Learning with Earables
- Multi-Task Learning with Earables
- Active Learning with Earables
- Low-Power Sensing Systems for Earables
- Authentication & Trust mechanisms for Earables
- Quality-Aware Data Collection with Earables
- Experience Sampling with Earables
- Crowd Sourcing with Earables
- Novel UI and UX for Earables

- Auditory Augmented Reality Application with Earables
- Lightweight Deep Learning on Earables
- Tiny Machine Learning on Earables
- Health and Wellbeing Applications of Earables
- Emerging applications of Earables

3.2 Workshop Program

In the past five editions of the workshop, we accepted, on average, more than ten high quality contributions from academic research groups, covering a broad area of topics related to earable computing.

The workshop program (full day) is intended to be an interactive one and will feature two keynotes, two technical sessions. We plan to invite luminaries in the area of mobile and wearable systems research as keynote speakers to set the tone of the workshop. Technical sessions will feature around ten papers, each focusing on specific themes related to Earable Computing:

- (1) Systems for Earables
- (2) Learning Algorithms for Earables
- (3) Novel Lifestyle Applications with Earables

Each session will host several long talks (15 minutes). We intend to keep the workshop open for all UbiComp 2025 attendees. However, we might need to limit attendees depending on the number of submitted research papers.

3.3 Organisation

- Website: Earable Computing Workshop will be hosted at <https://www.esense.io/earcomp2025/index.html>
- Publicity: The workshop will already have visibility through the eSense portal, and the participating research groups. In addition, we will maintain active community engagement through twitter and mailing lists.
- Paper Management: A PCS portal will be setup to manage the submissions.

4 EarComp History

The current proposal is towards organizing the sixth edition of the EarComp workshop and looks forward to holding its tradition of being co-located with UbiComp/ISWC. In the first edition of the workshop, we accepted ten contributions from academic research groups that are working with the eSense computing platform. Following the success of EarComp 2019, in 2021 we run the second edition of EarComp and we accepted nine high quality papers. These contributions covered a broad area of research topics related to earable computing including kinetic sensing, quality-aware data collection and machine learning, data platforms and auditory augmented reality, as well as health and wellbeing applications. In 2022, we hosted the third edition of the workshop (in Cambridge c/o UbiComp/ISWC 2022, in person) featuring eleven key contributions to the earable computing community. In 2023, we organized the fourth edition of the workshop in Cancun (c/o UbiComp/ISWIC 2023). This was a remarkable one, during which Dr. Alessandro Montanari and team publicly announced the launch of OmniBuds (Figure 2). Finally, last year, we organized the fifth edition of EarComp in Melbourne (c/o UbiComp/ISWIC 2024), featuring keynotes from superstars of the field such as Prof. Shyam Gollakota.

Figure 1: Collection of photos from the first edition of EarComp in 2019.

Figure 2: OmniBuds launch at EarComp 2023.

During the past editions, the workshop enumerated technical papers from leading researchers in the field working on earables including KIT, Georgia Tech, Cornell University, University of Cambridge, Google Brain, Apple, and Samsung among others. The

workshop also had a compelling keynote talk from key figures both from academia, such as Prof. Romit Roy Choudhury (UIUC) and Dr. Jamie A Ward (Goldsmiths University of London), as well as industry leaders like Hannu Kinnunen (co-founder of Oura),

Andrew Bellavia (ex Bragi, Doppler Labs, Amazon, Knowles Corp and founder of AuraFuturity), and Geoffrey Mackellar (Emotiv Lifesciences). Figure 1 shows the photos of the first edition of EarComp in 2019 (in person). More photos can be found at the [link](#).

5 Steering committee members

- Fahim Kawsar, Nokia Bell Labs, Cambridge
- Alessandro Montanari, Nokia Bell Labs, Cambridge
- Andrea Ferlini, Nokia Bell Labs, Cambridge

6 Program committee members

The program committee members comprise a set of eminent experts in diverse fields relating to earable systems. The tentative names of the program committee members are as follows:

- Dong Ma, Singapore Management University
- Marios Costantinides, Nokia Bell Labs Cambridge
- Yang Liu, University of Cambridge
- Yang Liu, Nokia Bell Labs Cambridge
- Ting Dang, University of Melbourne
- Khaldoun Al-Naimi, Nokia Bell Labs Cambridge
- Ashok Thangarajan, Nokia Bell Labs Cambridge
- Shijia Pan, UC Merced
- Jagmohan Chauhan, University of Southampton
- Jay Prakash, Silence Laboratories, Singapore
- Jun Han, Yonsei University
- Wen Hu, UNSW Sydney
- Zhenyu Yan, Chinese University of Hong Kong
- Mi Zhang, Michigan State University
- Rajalakshmi Nandakumar, Cornell Tech
- Bashima Islam, Worcester Polytechnic Institute
- VP Nguyen, University of Texas at Arlington/UMass Amherst
- Ho-Hsiang Wu, Bosch, USA

7 Workshop organizers

Alessandro Montanari is a Principal Research Scientist and Tech Lead of the Device Forms team at Nokia Bell Labs in the Pervasive Systems Research Department in Cambridge (UK). He holds a PhD in Computer Science from the University of Cambridge. At Bell Labs he leads a team investigating the architectural and algorithmic challenges of building practical wearable systems for human sensing exploiting ultra-low-power machine learning techniques. His research interests include expanding and improving the capabilities of modern sensory systems for efficient human sensing. He is particularly interested in ultra-wearable and ultra-low-power devices with a focus on novel sensing and computational techniques.

Andrea Ferlini is a Research Scientist at Nokia Bell Labs, Cambridge, UK and holds a PhD in Computer Science from the University of Cambridge, UK. At Bell Labs he is part of the Device Forms team, investigating the potential of earables, as well a number of alternative forms of sensing platforms, for a number of personal-scale applications. His research interests are focused around health and wellbeing sensing.

Mathias Ciliberto is a Research Associate in the Mobile System Research Lab at the University of Cambridge. He holds a PhD in Engineering from the University of Sussex. His research explores machine learning techniques for physiological human sensing, particularly in healthcare applications and low-powered devices like wearables and earables. His research interests extend to novel sensor modalities, hardware development and real-life applications of wearable sensors.

Longfei Shangguan is an assistant professor in Computer Science at the University of Pittsburgh. His research focuses on developing mobile and embedded systems, particularly in the field of earable computing. Prof. Shangguan received the NSF CAREER award in 2024, an AIoTsys Young Scientist Award, and a Google Research Scholar Award in 2023. His research has been highlighted by Get-Mobile twice, and he has received a best paper runner-up award at MobiCom'21, and a distinguished paper award at IMWUT'17.
